1. PURPOSE AND NEED FOR ACTION

1.1 Introduction

The Tulalip Tribes (Tribes), in partnership with the Washington State Department of Transportation (WSDOT), Snohomish County, and the City of Marysville (City), propose to develop and implement access improvements to two interchanges on the Interstate 5 (I-5) corridor within the boundary of the Tulalip Reservation in Snohomish County, Washington. The two interchanges are at 4th Street (also known as State Route [SR] 528 and Marine Drive) and 88th Street NE.

The Tribes prepared this environmental assessment (EA) in accordance with the National Environmental Policy Act of 1969 (NEPA) (42 United States Code [USC] 4321 to 4347); the Council on Environmental Quality (CEQ) regulations for implementing the procedural provisions of NEPA (40 Code of Federal Regulations [CFR] parts 1500 through 1508); the U.S. Department of the Interior requirements listed in Department Manual Part 516, Chapters 1-15; and the Indian Affairs NEPA Guidebook (59 Indian Affairs Manual 3-H). An EA discloses relevant environmental information concerning potential project alternatives, including the proposed action and the no action alternative, and is intended for use by both decision-makers and the public.

The need for this analysis arises from the Bureau of Indian Affairs' (BIA) responsibilities under NEPA to review proposals for the use of tribal lands held in trust by the United States, including the granting of right-of-way (ROW). The authority of the Secretary of the Interior is to grant the use of ROW, according to 25 USC 323. In order for BIA to comply with NEPA, the determination of effect regarding environmental resources must be issued. Therefore, an EA is necessary to analyze the direct, indirect, and cumulative impacts of the I-5/4th and 88th Street NE Corridor Improvements project. Appendix A includes the Proposed Right-of-Way Acquisition Plan.

1.2 Proposal and Need for the Proposal

The purpose of the I-5/4th and 88th Street NE Corridor Improvements project (Project) is to support economic vitality and livability for the Tribes, indirectly supporting neighboring jurisdictions of the City and Snohomish County, by reducing congestion and improving safety and mobility for cars, trucks, emergency services, pedestrians and bicycles, and transit users traveling to, from, and across I-5 on 88th Street NE and 4th Street. Most of the project occurs within existing road ROW; however, a small portion would require the expansion of existing road ROW on tribal lands. Therefore, the BIA is the designated federal lead agency.

The project involves improvements near the I-5 interchanges with 4th Street (exit 199) and 88th Street NE (exit 200). The project corridor is located at the boundary between the Tulalip Reservation and Marysville in Snohomish County, Washington (Figure 1-1).

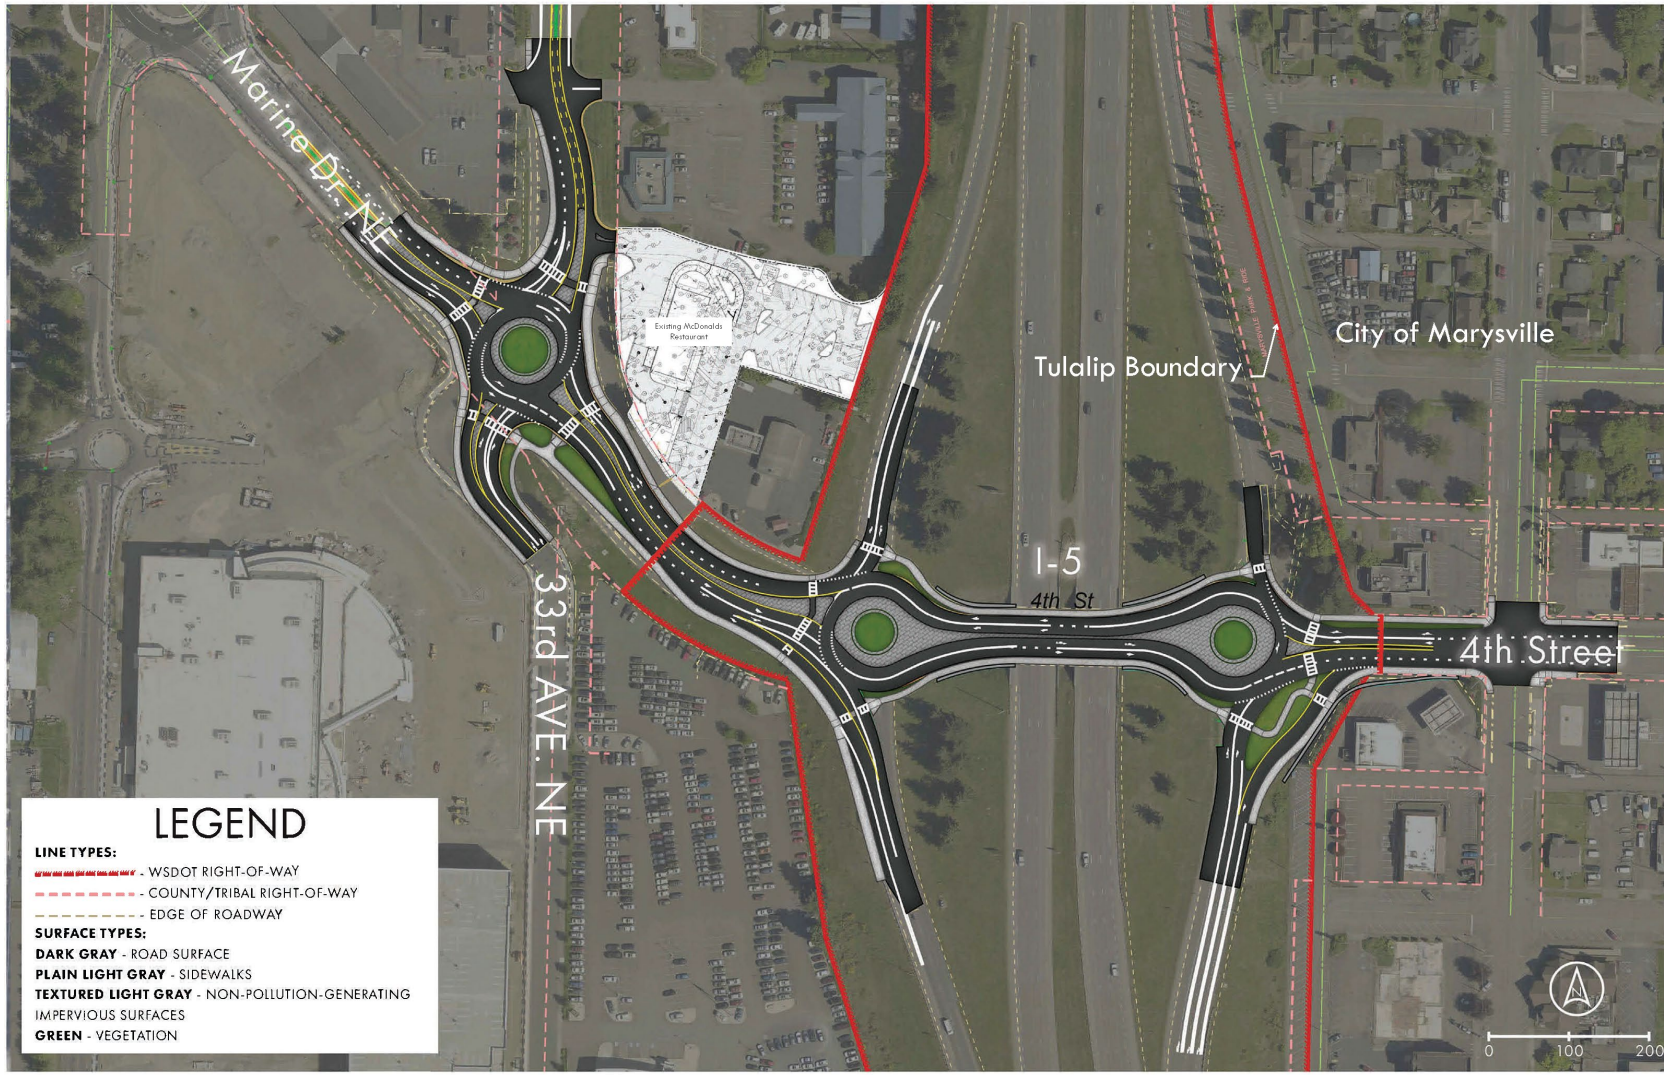
Following environmental review, the Tribes will complete design documentation and ROW acquisition. Construction is planned to begin in summer 2025 and end in summer 2028.

Figure 1-1.
Vicinity Map
I-5/4th Street and 88th Street NE Corridor Improvements
Snohomish County, WA

The project would include corridor improvements along 4th Street and 88th Street NE as well as fish passage enhancements and stream habitat improvements at the 88th Street NE crossing of Coho Creek. Additional details about these project elements follow.

Corridor improvements along 4th Street, from west to east, would include the following (Figure 1-2):

- Replacement of the signaled intersection of 4th Street and 33rd Avenue NE with a new roundabout
- Replacement of the signaled intersection of 4th Street and the I-5 southbound on-/off-ramps with a new roundabout
- Replacement of the signaled intersection of 4th Street and the I-5 northbound on-/off-ramps with a new roundabout
- Channelization improvements entering and exiting the roundabouts
- Reconfigured pedestrian and bicycle access along the alignment
- Stormwater treatment and flow control

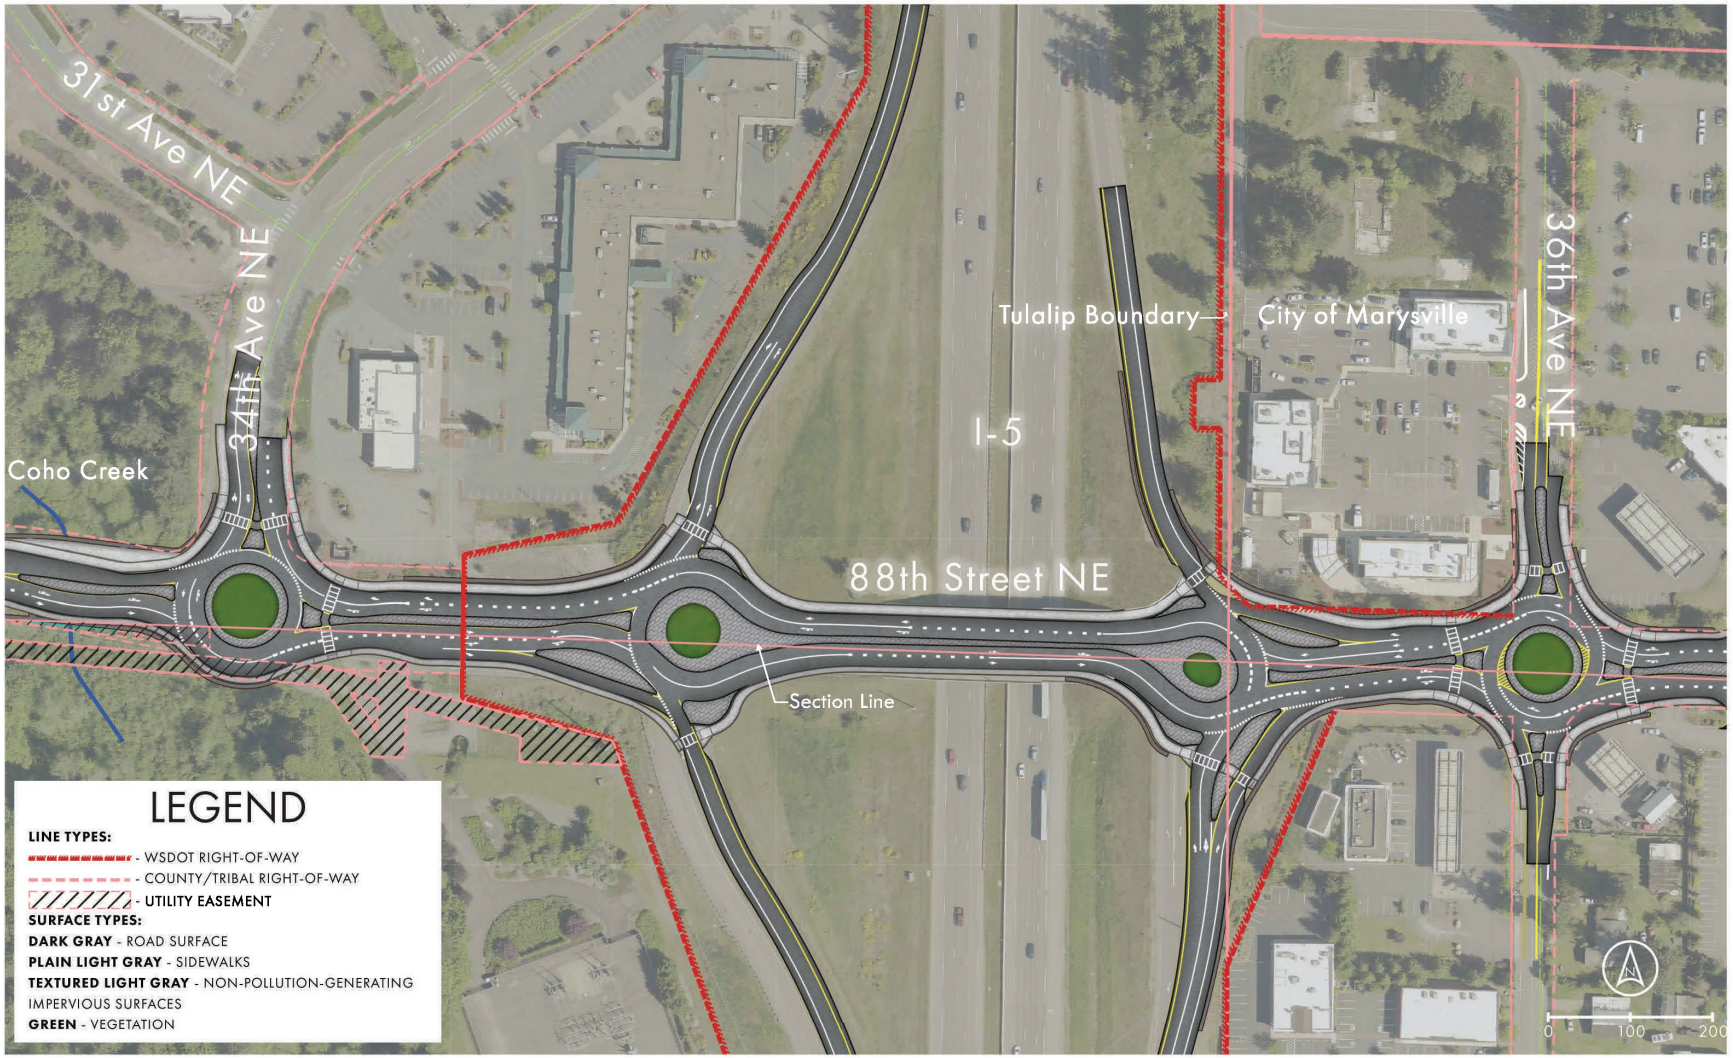


4TH STREET ILLUSTRATIVE PLAN

Figure 1-2.
Proposed Improvements at 4th Street

Corridor Improvements along 88th Street NE, from west to east, would include the following (Figure 1-3):

- Fish passage improvements at Coho Creek
- Replacement of the signaled intersection of 88th Street and 34th Avenue NE (Quil Ceda Boulevard) with a new roundabout
- Replacement of the signaled intersection of 88th Street NE and the I-5 southbound on-/off-ramps with a new roundabout
- Replacement of the signaled intersection of 88th Street NE and the I-5 northbound on-/off-ramps with a new roundabout
- Replacement of the signaled intersection of 88th Street and 36th Avenue NE with a new roundabout
- Channelization improvements entering and exiting the roundabouts
- Reconfigured pedestrian and bicycle access along the alignment
- Stormwater treatment and flow control



88TH STREET ILLUSTRATIVE PLAN

Figure 1-3.
Proposed Improvements at 88th Street NE

1.3 Regulations That Apply

The project is subject to the following federal, tribal, state and local laws, executive orders (EOs), and secretarial orders.

Federal

- Americans with Disability Act
- American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act, Secretarial Order 3206
- Archaeological Resources Protection Act
- Bald and Golden Eagle Protection Act
- Coastal Zone Management Act
- Clean Air Act, as amended
- Compensatory Mitigation for Losses of Aquatic Resources (2008), Final Rule
- Consultation and Coordination with Indian Tribal Governments, Presidential EO 13084
- Departmental Responsibilities for Indian Trust Resources, Secretarial Order 3175
- Endangered Species Act (ESA)
- Federal Water Pollution Control Act, as amended
- Freedom of Information Act
- Magnuson–Stevens Fishery Conservation and Management Act Migratory Bird Treaty Act
- Native American Graves Protection and Repatriation Act (NAGPRA)
- National Historic Preservation Act (NHPA)
- Protection of Wetlands, Presidential, Presidential EO 11990
- Privacy Act
- Protection and Enhancement of Environmental Quality, Presidential EO 11514
- Treaty of Point Elliott of 1855

Tribal

- Tulalip Tribal Code (TTC)

State

- Hydraulic code of Washington
- Protection of Wetlands, Governor EO 89-10
- Protection of Wetlands, Governor EO 90-04

- Washington State Environmental Policy Act
- Washington Growth Management Act
- Washington Water Pollution Control Act

Local

- City of Marysville Municipal Code
- Snohomish County Code

1.4 Permits and Approvals

Prior to construction, the project is anticipated to be subject to the following federal, tribal, state, and local permits and approvals:

- U.S. Corps of Engineers Section 404 Clean Water Act approval
- U.S. Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) construction stormwater approval
- Washington State Department of Ecology (Ecology) Coastal Zone Management Act Approval
- Tulalip Tribes Section 401 Water Quality Certification approval
- Ecology NPDES Approval
- WSDOT Right-of-way Use permit
- Snohomish County Right-of-way Use Permit
- City of Marysville Right-of-way use permit
- Tulalip Tribes Grading Permit

2. ALTERNATIVES

For an EA where there are no unresolved conflicts with respect to alternative uses of available resources, only the proposed action needs to be considered (43 CFR 46.310[b]). Even if there are no unresolved conflicts, the No Action alternative may also be considered in EAs. The No Action alternative provides a useful baseline for comparison of environmental effects (including cumulative effects) and demonstrates the consequences of not meeting the need for the action. The description of the No Action alternative depends on the type of action proposed. It can either be no change from the current management practices or a description of what is reasonably foreseeable if the proposed action does not take place.

For the I-5/4th Street and 88th Street NE Corridor Improvements, this EA considers the No Action alternative relative to the Proposed Action.

2.1 Introduction

The following sections provide information on the two alternatives considered for this proposal:

- No Action alternative
- I-5/4th Street and 88th Street NE Corridor Improvements alternative (Proposed Action)
- Alternatives considered but eliminated from detailed analysis

2.2 No Action Alternative

Under the No Action alternative, the I-5/4th Street and 88th Street NE Corridor Improvements project would not be built. The two interchanges at 88th Street NE and 4th Street/SR 528/Marine Drive NE would continue to experience congestion, safety, and mobility challenges for cars, trucks, pedestrians, and transit users. I-5 traffic exiting to enter Tulalip Tribes or the City of Marysville at both interchanges would continue to experience off-ramp backups that can extend back on to the I-5 mainline lanes of traffic. This deficiency would continue to impact the Tribes and the City as well as the greater Snohomish County area, interstate travel and commerce, and even international trade with Canada. The configuration of the local road connections at the interchanges would also continue to hinder commuters, residents, visitors, freight, transit, and nonmotorized connections between the Tribes and the City of Marysville. Under the No Action alternative, these deficiencies would continue to cause lengthy delays at the signals crossing I - 5 between these two communities for commerce and emergency services.

Under the No Action alternative, fish passage improvements at Coho Creek would not be built. Benefits to the stream and fish and wildlife that occur in or along it would not be realized.

2.3 Proposed Action

Under the Proposed Action, the I-5/4th Street and 88th Street NE Corridor Improvements project would be built. Roadway congestion as is currently experienced at both interchanges would improve. The following describes the improvements associated for each corridor:

2.3.1 4th Street

The 4th Street corridor project area would provide the following benefits:

- Improved business and residential access for the Tribes by decreasing roadway congestion along 4th Street.
- Maintained or improved operations at the intersection of 4th Street/Cedar Avenue.
- Improved safety by converting existing signals to roundabouts.
- Improved safety and mobility for the general traveling public on the interstate and ramps by reducing queue spillbacks.

2.3.2 88th Street NE

The 88th Street NE corridor project area would provide the following benefits:

- Improved business and residential access for the Tribes by decreasing roadway congestion along 88th Street.
- Maintained or improved operations at the City intersection of 88th Street/36th Avenue NE.
- Improved safety by converting existing signals to roundabouts.
- Improved safety and mobility for the general traveling public on the interstate and ramps by reducing queue spillbacks.
- Improved fish passage and increased stream, wetland, and riparian habitat at Coho Creek.

2.4 Alternatives Considered but Eliminated from Detailed Analysis

A Non-Access Feasibility Study, as required by WSDOT, was prepared for the project (Parametrix 2022a). Among other objectives, the study examined and screened alternatives for meeting the project purpose and need. Ten alternatives were considered (five at each interchange area). These alternatives presented various combinations of signal improvements, channelization improvements, and the use of roundabouts along the two corridors and the associated on- and off-ramps of I-5. After a two-step screening process, the actions proposed in this EA were selected as the preferred alternative.

3. DESCRIPTION OF THE AFFECTED ENVIRONMENT AND IMPACTS

3.1 Introduction

This chapter discusses the potentially affected environment in and around the Project area. For each resource, the narrative includes a characterization of current conditions, a description of potential impacts to the resource that could occur from the implementation of the alternatives, and a discussion of mitigation and minimization measures.

While impacts to all the resources were considered, only those that could be impacted are described. For the remaining resources, a brief statement of why the resource would not be affected is included in Table 3-1. Resources with no impact expected will not be discussed further in the EA.

Table 3-1. Resources Excluded from Analysis

Resource	Rationale
Geology, Mineral, and Paleontological Resources	The Proposed Action would be in an area that has undergone urban development and has no history of geological, mineral, or paleontological resources.
Employment and Income	The Proposed Action would not change employment and income and has the potential to improve access to employment.
Demographic Trends	The Proposed Action would not change demographic trends.
Lifestyle and Cultural Values	The Proposed Action would not alter lifestyle and cultural values.
Hunting, Fishing, Gathering	The Proposed Action would not reduce access to hunting, fishing, or gathering. The Proposed Action may improve access.
Timber Harvesting	Not applicable.
Agriculture	The Proposed Action would occur on major roadway corridors in a commercially developed area, not near agricultural activity.
Land Use Plans	The Proposed Action would not change land use.
Wilderness	The Proposed Action would not be in or near a wilderness.
Parks	The Proposed Action would not alter parks or recreation activities.
Visual	The Proposed Action would include decorative railings, walls, and public art, which are considered enhancements.
Public Health and Safety	The Proposed Action is considered an enhancement to public health and safety.
Indian Trust Assets	The Proposed Action would be a Tribal project that would meet the Tribe's needs.

In addition to providing a description of existing conditions, impacts, and mitigation, the following sections include a brief overview of data collection and analysis. The study area is also defined as appropriate. Unless otherwise specified, the study area for each of the resources evaluated in the sections below is shown in Figure 1-1.

3.2 Land Resources – Topography and Soils

3.2.1 Data Collection and Analysis

The information for the topography and soils discussion was primarily drawn from the Preliminary Geotechnical Report (HWA 2022) prepared on behalf of the I-5/4th Street and 88th Street NE Corridor Improvements project.

The Preliminary Geotechnical Report was prepared to support design through the evaluation of existing soil and groundwater conditions. Geotechnical field investigations specific to this project included 17 machine-drilled borings and four groundwater monitoring wells. These explorations occurred at or near the proposed locations of bridge piers for the Coho Creek crossing, stormwater facilities, and retaining structures to provide soil and groundwater information in support of roadway design. The recommendations provided in the Preliminary Geotechnical Report also consider historic geotechnical data collected for other projects in the area and existing mapping showing general geologic conditions. Drawing from the Preliminary Geotechnical Report, this narrative summarizes existing conditions and geotechnical design considerations for the proposed corridor improvements.

3.2.2 Existing Conditions

This section discusses the existing topography and soil conditions for each project area corridor as shown in Figures 1-2 and 1-3. The project alignments are both located within the Puget Lowland, and the major geologic unit is Recessional Outwash, Marysville Sand Member (Gvrm), which includes sand with imbedded silts and clays. Preliminary geologic exploration also found that both corridors have similar subsurface conditions, consisting mostly of varying amounts of fill or topsoil above Marysville Sand. The nearest fault (the Southern Whidbey fault) is more than 6 miles from both locations. Geotechnical exploration found that both corridors are underlain with course-grain and fine-grained Marysville Sand of various densities, indicating susceptibility to liquefaction, if fully saturated (HWA 2022).

The major soil type within the 4th Street corridor, as identified by the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS) Web Soil Survey, is Ragnar Fine Sandy Loam. The 4th Street corridor has an elevation gain from west to east, starting at approximately 21 feet above mean sea level (AMSL) to about 32 feet AMSL over a distance of approximately 1,000 feet. Groundwater encountered during geotechnical borings ranged from 6.4 to 14 feet below ground surface (HWA 2022).

The major soil types within the 88th Street NE corridor, as identified by the U.S. Department of Agricultural NRCS Web Soil Survey, are Norma loam and Ranar fine sandy loam. The 88th Street NE corridor has an elevation gain from west to east, starting at approximately 34 AMSL to about 53 feet AMSL over a distance of approximately 1,500 feet. Groundwater encountered during geotechnical borings ranged from 7 to 39 feet below ground surface (HWA 2022). A portion of the Coho Creek bridge alignment is underlain by compressible peat deposits of saturated Marysville sands.

3.2.3 Environmental Consequences

Under the No Action alternative, no changes would occur to the existing geology, topography, and soils; therefore, there is no potential for construction-related erosion. Located in an area with underlying liquefaction-prone soils, the existing roadway corridors have the potential to sustain damage in an earthquake, notably the 88th Street NE overpass that extends over I-5 and the I-5 overpasses that extend over 4th Street (WSDOT 2022a). WSDOT has an ongoing bridge preservation program that includes seismic retrofits to minimize and avoid catastrophic bridge failures. Bridges are inspected every 2 years to ensure

they are in good working order and to prioritize maintenance and preservation work (WSDOT 2022b). Under both the No Action alternative and Proposed Action, WSDOT would continue to inspect the bridges to determine whether seismic retrofits or other repairs are necessary to preserve their integrity.

Under the Proposed Action, no long-term impacts to geology, topography, and soils are expected. The sites are relatively flat, minimizing the potential for landslide and slope instability. To mitigate for the presence of liquefaction soils in both corridors, project design will consider appropriate mitigation measures, such as low soldier pile or sheet pile walls to prevent liquifiable soils from lateral spreading and bearing capacity failure, or implementing ground improvements, such as stone columns.

Because a portion of the proposed Coho Creek bridge alignment in the 88th Street corridor is underlain by compressible peat deposits, foundations for the proposed structure would be designed to resist down-drag loading associated with seismic liquefaction-induced settlement and consolidation of settlements. To reduce or eliminate the potential for settlements, settlement mitigation would be implemented for roadway widening and grade increases to offset increased loads. Depending on the extent of the peat deposit, the bridge would be designed with approach slabs to account for potential long-term settlement. Utilities would be installed with flexible connections that can tolerate anticipated long-term differential settlements between the approach fill and bridge structure wherever utilities transition from grade to structural support. Long-term maintenance would be employed to remedy pavement distress associated with settlement that is expected to occur in the long-term.

Short-term (construction) impacts of the Proposed Action would likely involve grading, excavation, backfilling, and vegetation removal. On-site soils unsuitable for use as fill would be hauled to an approved offsite location. Structural fill and compaction of the fill would comply with WSDOT Standard Specifications (WSDOT 2022c). Temporary excavation would conform with Part N of the Washington Administrative Code (WAC) 296-155, which requires either maintaining excavation depths greater than 4 feet with shoring or with a slope no steeper than what is allowed. The Proposed Action would incorporate plan specifications specific to wet weather or in wet conditions to prevent soil disturbance, erosion, and ponding and to encourage infiltration.

3.2.4 Mitigation

With appropriate implementation of engineering design standards and construction best management practices (BMPs), geological and soils impacts are not expected, and additional mitigation is not required. Sections 3.5.3 and 3.5.4 describe the replanting of areas temporarily disturbed during construction.

3.3 Water Resources – Surface Water

3.3.1 Data Collection and Analysis

The surface water discussion is focused on stormwater. Existing conditions were drawn from the draft hydraulic reports prepared on behalf of the I-5/4th Street and 88th Street NE Corridor Improvements project (Parametrix 2023a,b), while environmental consequences are based on design revisions resulting from coordination with the National Marine Fisheries Service (NMFS) during formal consultation under the ESA. The surface water discussion in this EA summarizes the findings of these reports, including existing site conditions, such as existing soils and stormwater facilities, and the proposed drainage and stormwater improvements tailored to the corridor improvements. The study areas for each study corridor are defined by the threshold discharge areas (TDAs), as described in greater detail below.

3.3.2 Existing Conditions

The following sections discuss the existing surface water conditions for each corridor, with an emphasis on stormwater. Both the 4th Street and the 88th Street NE corridors are within the Lower Quilceda Subbasin (Figure 3-1) in Snohomish County within Water Resource Inventory Area (WRIA) 7.

Neither project corridors are in the immediate vicinity of a floodplain as determined by reviewing a map from the Federal Emergency Management Agency (FEMA). No subsurface drainage problems have been identified within the project limits.

According to the Snohomish County Critical Aquifer Recharge Areas map, the project is not within a Sole Source Aquifer and not within a Wellhead Protection Area (Snohomish County 2022). The United States Geological Survey (USGS) Aquifer Sensitivity for the site is moderate (USGS 1997).

3.3.2.1 4th Street

The project area west of I-5 and outside of WSDOT ROW drains to the Ebey Slough of the Snohomish River via Quilceda Creek or a wetland adjacent to Ebey Slough. Most of the area within the WSDOT ROW drains through ditches and pipes directly to Ebey Slough. The area east of the WSDOT ROW is routed through the Marysville stormwater system that discharges into Ebey Slough. The TDAs, stormwater facilities, and outfalls for the 4th Street project footprint are shown in Figure 3-2 and details regarding TDA size, discharge type, and receiving waters are provided in the Table 3-2.

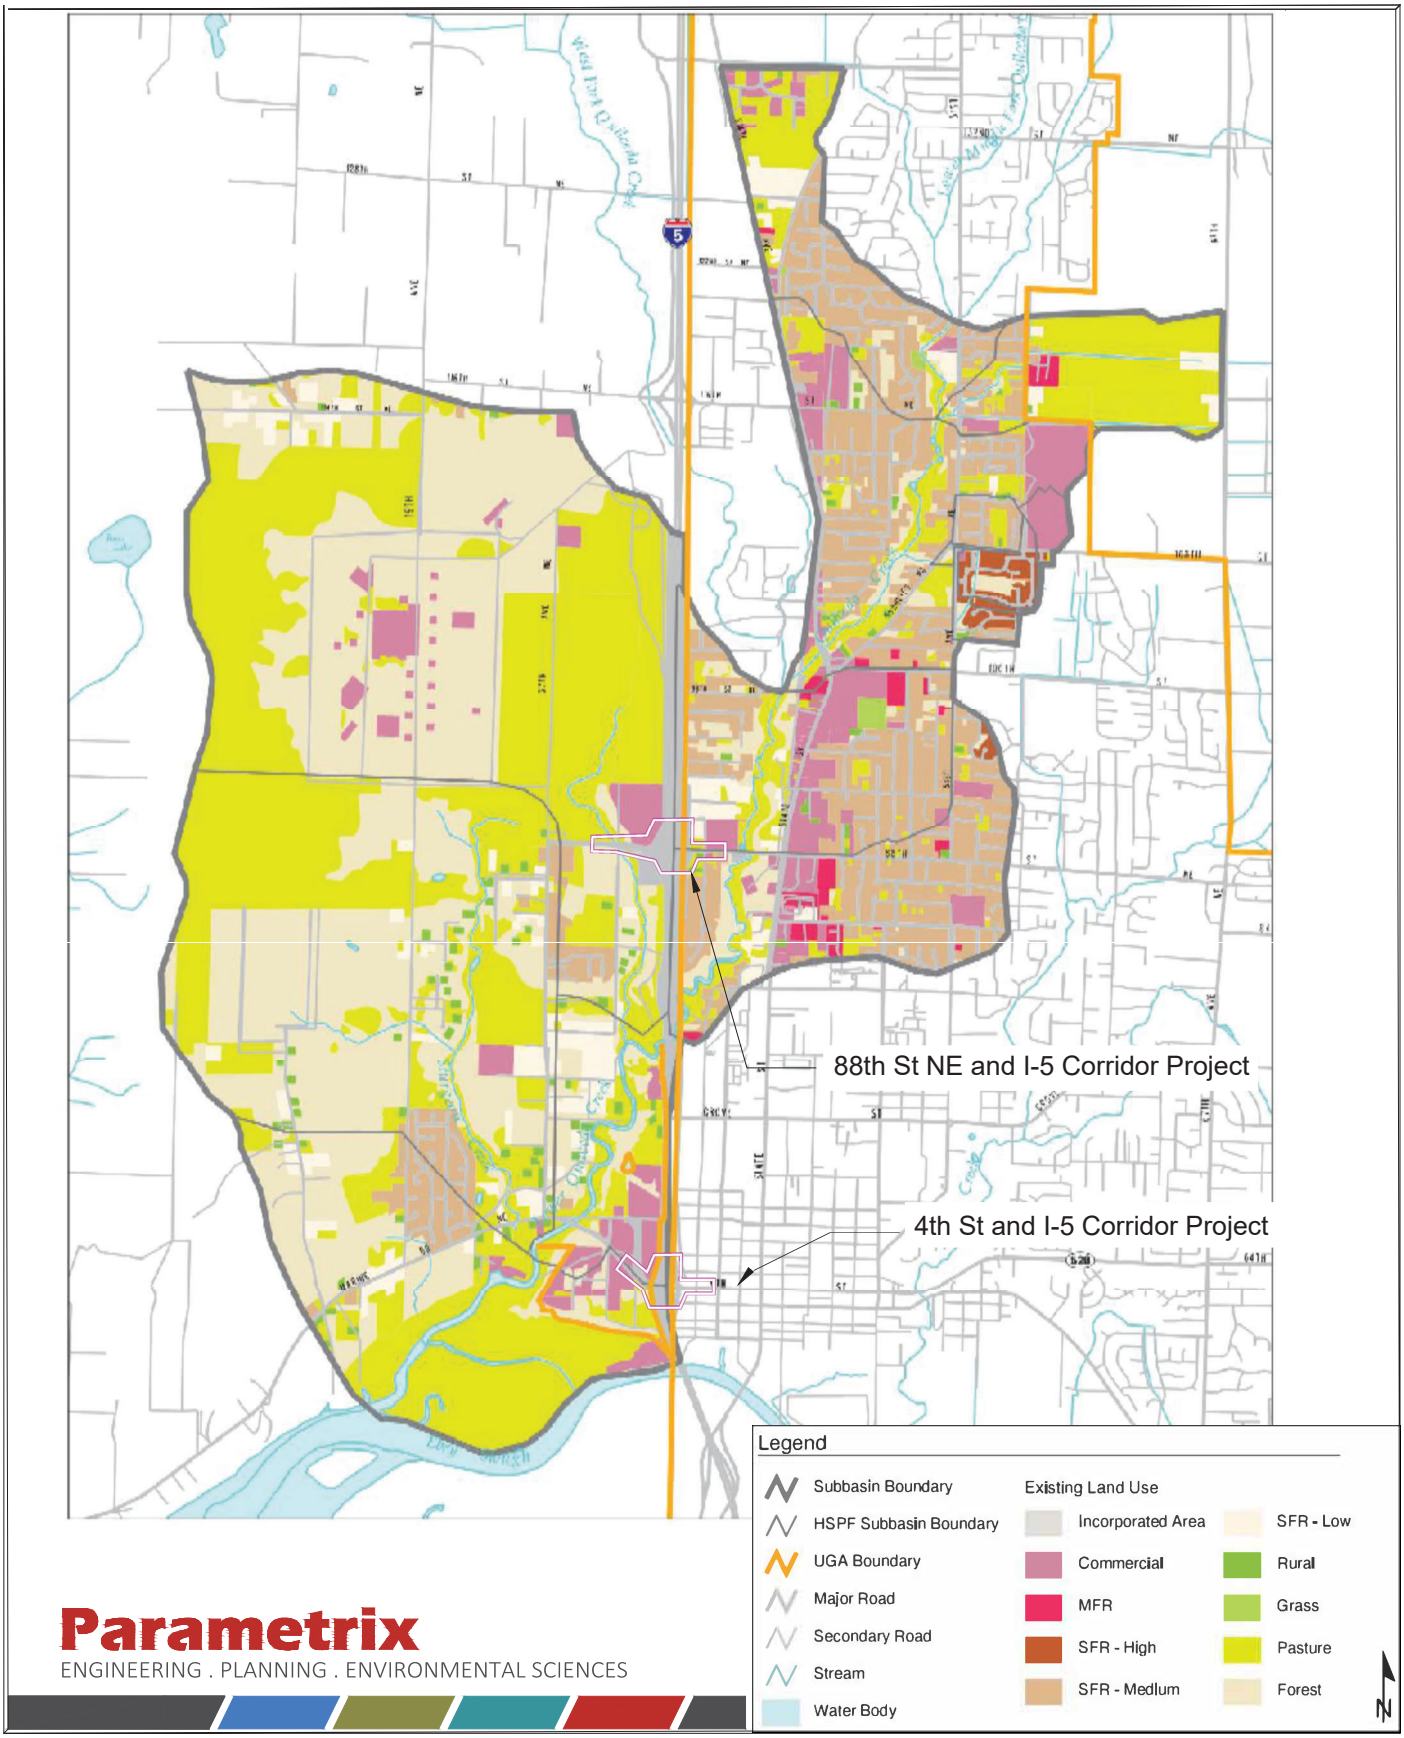


Figure 3-1.
Lower Quilceda Subbasin

I-5/4th Street and 88th Street NE Corridor Improvements

Figure 3-2.
4th Street Corridor Total Discharge Areas (TDA's), Stormwater Facilities, and Outfalls
I-5/4th Street and 88th Street NE Corridor Improvements
Snohomish County, WA

Table 3-2. Existing TDA Information

TDA Number	TDA Area (acres)	Discharge Type	Receiving Water
1	3.93	Surface Water	N/A (discharges to wetland)
2	0.55	Surface Water	Quilceda Creek
3	10.33	Surface Water	Ebey Slough
4	0.88	Surface Water	Ebey Slough

Within the project footprint, there is an existing bioretention area that provides stormwater treatment for the Chevron gas station at the northwest corner of the intersection of Marine Drive NE and 33rd Avenue NE. This bioswale does not treat any stormwater runoff from the project's ROW. There is an island at the intersection of Marine Drive NE and 33rd Avenue NE that is reported to have some flooding. This is a local point of discharge for several private parcels.

Based on the Washington State Department of Ecology's (Ecology's) Water Quality Assessment, the impaired water bodies in the vicinity of the project are listed in Table 3-3 (Ecology 2022a).

Table 3-3. Impaired Water Bodies in the Vicinity of the Project

Category[1]	Water Resource Inventory Area	Water Body Name	Parameter	Listing ID[2]
2	7	Ebey Slough	Bacteria – Fecal Coliform	9797
4a	7	Ebey Slough	Dissolved Oxygen	40626
2	7	Ebey Slough	Sediment Bioassay	9269

[1] Category 1: Meets tested standards for clean waters.
Category 2: Waters of concern.
Category 4: Polluted waters that do not require a total maximum daily load (TMDL).
Category 4a: Water bodies that have an approved TMDL.
Category 4b: Water bodies that have a pollution control plan in place adopted by the Washington State Department of Ecology.
Category 4c: Water bodies that are impaired by a non-pollutant.
Category 5: Polluted waters that require a TMDL; there is currently no TMDL control plan.

[2] Source: Ecology 2022a

3.3.2.2 88th Street NE

Stormwater drains into the Lower Quilceda Subbasin, which discharges via Quilceda Creek to Ebey Slough of the Snohomish River through a series of pipes, culverts, and ditches. The TDAs, stormwater facilities, and outfalls for the 88th Street NE project footprint are shown in Figure 3-3 and details regarding TDA size, discharge type, and receiving waters are provided in Table 3-4.

Table 3-4. Existing TDA Information

TDA Number	TDA Area (acres)	Discharge Type	Receiving Water
5	7.08	Surface Water	Coho Creek
6	5.73	Subsurface	N/A
7	4.06	Subsurface/Surface Water	N/A, Unknown
8	2.67	Surface Water	Quilceda Creek
9	1.89	Subsurface	N/A
10	0.02	Subsurface	N/A

Figure 3-3.
88th Street Corridor Total Discharge Areas (TDA's), Stormwater Facilities, and Outfalls
I-5/4th Street and 88th Street NE Corridor Improvements
Snohomish County, WA

There are several stormwater treatment facilities located within or near the project footprint. According to design drawings from the Tribes, a 1-foot-deep bioswale with an inlet from the ROW is located on the west side of 34th Avenue NE, north of 88th Street NE. An infiltration swale at Quil Ceda Boulevard and 31st Avenue NE treats some of the stormwater runoff from the project area on Quil Ceda Boulevard. On the east side of I-5 and Marysville, there is an existing drainage pond outside of the project area, which receives runoff from within the project area before outfalling eastward to Quilceda Creek. This pond was constructed as part of a WSDOT project but is maintained by the City of Marysville. As reported in the draft hydraulic report (Parametrix 2023a), the City of Marysville has indicated that the pond currently has issues with flooding. The parcels on the southeast and southwest corners of the intersection of 88th Street NE and 36th Avenue NE currently have stormwater treatment and infiltration facilities on their properties that accept water from the ROW, according to as-builts provided by Marysville. Some stormwater is discharged to Coho Creek without prior treatment or flow control. It is also possible that some stormwater may enter Quilceda Creek if stormwater does not completely infiltrate in the conveyance ditches running along either side of I-5, which were not designed for treatment, or potentially if the stormwater treatment pond on the north side of 88th Street NE and east of the I - 5 interchange exceeds capacity.

Based on the Ecology's 2018, the impaired water bodies in the vicinity of the project are listed in Table 3-5.

Table 3-5. Impaired Water Bodies in the Vicinity of the Project

Category[1]	Water Resource Inventory Area	Water Body Name	Parameter	Listing ID[2]
5	7	Quilceda Creek	Dissolved Oxygen	7302
4A	7	Quilceda Creek	Bacteria	7306

[1] Category 1: Meets tested standards for clean waters.
Category 2: Waters of concern.
Category 4: Polluted waters that do not require a total maximum daily load (TMDL).
Category 4a: Water bodies that have an approved TMDL.
Category 4b: Water bodies that have a pollution control plan in place adopted by the Washington State Department of Ecology.
Category 4c: Water bodies that are impaired by a non-pollutant.
Category 5: Polluted waters that require a TMDL; there is currently no TMDL control plan.

3.3.3 Environmental Consequences

The following sections discuss environmental consequences related to stormwater. Narrative unique to each project corridor is provided in their respective subheadings, while overall environmental consequences that are relevant to both alternatives are provided in the subsection entitled "both corridors."

3.3.3.1 4th Street

Under the No Action alternative, the flooding at the intersection of Marine Drive NE and 33rd Avenue NE would likely continue to persist. Stormwater from the WSDOT ROW would continue to Ebey Slough untreated.

Under the Proposed Action, the proposed conveyance system would alleviate the ponding and treat stormwater. The existing bioretention area on the Chevron gas station's private property at the

northwest corner of the intersection of Marine Drive NE and 33rd Avenue NE would be impacted by the Proposed Action. This area would be repaired or replaced in-kind outside of the ROW to restore full function. Stormwater from the project area would be treated before discharging to Ebey Slough.

3.3.3.2 88th Street NE

Under the No Action alternative, untreated stormwater would continue to be conveyed to Coho Creek and potentially Quilceda Creek. The existing drainage pond operated by the City of Marysville that receives discharge from TDA 8 would continue to flood.

Under the Proposed Action, stormwater from the project area would receive enhanced treatment to the maximum extent practicable prior to entering Coho Creek. Most of the stormwater from the project area going to Quilceda Creek would also receive enhanced treatment. A proposed infiltration facility with enhanced treatment may reduce the flow going to the City of Marysville-operated pond, which could alleviate some of the flooding.

3.3.3.3 Both Corridors

The No Action alternative would not have an increase in pollution generating impervious surface (PGIS), but there would be no improvements to the existing stormwater treatment system that would have a beneficial effect on water quality. Because no construction would occur under the No Action alternative, there would be no risk of increased water quality impacts to wetlands and streams in the project area caused by construction.

The Proposed Action would reduce the area of impervious surfaces from which runoff may discharge to surface waters (Table 3-6). These reductions would help restore flow regimes in streams that receive runoff from project-related surfaces. Reductions would occur in all TDAs except TDA 3. Runoff from that TDA flows to Ebey Slough; the volume of runoff from the small area of added impervious surfaces would be too small to cause any measurable change in the volume of water that flows through the slough.

In addition, the Proposed Action would provide treatment for stormwater runoff from an area of PGIS equal to or greater than the area of PGIS that would be added or replaced for project construction, resulting in improved water quality. For the project as a whole, the area of treated PGIS would be 1.46 times the area of added or replaced PGIS. At the scale of the individual TDAs, the ratio of PGIS receiving treatment to project-related PGIS would range from 1.04 to 1.85 (Table 3-6).

Table 3-6. Impervious Surface Area Changes and PGIS Treatment Ratios in Project TDAs

TDA	Receiving Water	Change in Impervious Surface Discharge Area (acres)[1]	Ratio of Treated PGIS to Project-Related PGIS[2]
1	Ebey Slough	−0.18	1.47
2	Quilceda Creek	−0.08	1.85
3	Ebey Slough	+0.35	1.63
4[3]	Ebey Slough	−0.01	1.04
5	Coho Creek	−1.40	1.54
6	Quilceda Creek	−0.81	1.41
7	Quilceda Creek	−0.58	1.19
8	Quilceda Creek	−0.74	1.45

Table 3-6. Impervious Surface Area Changes and PGIS Treatment Ratios in Project TDAs (continued)

TDA	Receiving Water	Change in Impervious Surface Discharge Area (acres)[1]	Ratio of Treated PGIS to Project-Related PGIS[2]
9	Quilceda Creek	–0.14	1.09
10	Quilceda Creek	–0.01	1.18
Total		***–3.60***	***1.46***

[1] The change is calculated as the difference between impervious surfaces that would be added, minus those converted to pervious surfaces or from which runoff would be directed to facilities that infiltrate into the ground.

[2] Treated PGIS consists of PGIS that would be removed or from which runoff would be directed to new treatment facilities. Project-related PGIS consists of PGIS that would be added or modified for project construction.

[3] Runoff from TDA 4 would receive treatment in the Marysville Regional Treatment Facility.

The Proposed Action would not be expected to be a significant source of fecal coliform bacteria or contribute to the existing water quality problems in Ebey South or Quilceda Creek because stormwater runoff from new pavement within the project would be treated and some would be infiltrated.

The Proposed Action would maintain existing recharge rates to the total aquifer by enhancing infiltration to compensate for increased impervious area. The water quality of runoff would be improved before infiltration by using pretreatment methods. The permanent effects on critical aquifer recharge areas would be mitigated by the infiltration, which would maintain recharge rates within the overall surrounding aquifers.

The Proposed Action could release sediment or other pollutants to surface waters during construction. However, a project-specific Stormwater Pollution Prevention Plan (SWPPP) and Temporary Erosion and Sediment Control (TESC) plan would be prepared and implemented before beginning earthwork under the project's National Pollutant Discharge Elimination System (NPDES) Construction Stormwater General Permit. It is anticipated that the sediment and flow-control BMPs described in the TESC and SWPPP would minimize the potential for water quality impacts to wetland and stream resources in the project area during construction.

3.3.4 Mitigation

With appropriate implementation of engineering design standards and construction BMPs, significant impacts on water resources are not expected, and additional mitigation is not required.

3.4 Air Quality and Greenhouse Gas Emissions

3.4.1 Data Collection and Analysis

A known formal emissions inventory, including comprehensive air quality monitoring, has not been conducted for the study area. The majority of the content in this section is drawn from the I-5/4th Street and 88th Street NE Corridor Improvements Intersection Control Evaluation (herein, 2022 Intersection Control Evaluation) (Parametrix 2022b). The study area for the intersection control report included the following intersections:

- 88th Street NE at Quil Ceda Boulevard
- 88th Street NE at southbound I-5 ramps
- 88th Street NE at northbound I-5 ramps
- 88th Street NE at 36th Avenue NE

- 4th Street at 33rd Avenue NE
- 4th Street at southbound I-5 ramps
- 4th Street at northbound I-5 ramps

This narrative is based on the characterization of idling and stop-and-go traffic described in the 2022 Intersection Control Evaluation relative to reduced air quality. Using projected traffic volumes, the environmental consequences section compares the level of service (traffic flow) under the No Action alternative and Proposed Action at the representative intersections listed above.

3.4.2 Existing Conditions

All of the Reservation and Snohomish County meet National Ambient Air Quality Standards (NAAQS) (Ecology 2022b).

Current configurations of the I-5/4th and 88th Street NE corridors result in extensive congestion during peaks hours, causing back-ups that can extend onto the I-5 mainline lanes of traffic that result in lengthy delays at the signals crossing I-5. As described in the 2022 Intersection Control Evaluation, 2019 traffic issues along the 4th Street AM peak included stop-and-go traffic destined to southbound I-5; southbound I-5 on-ramp being over capacity, spilling onto local streets; and stop-and-go westbound traffic that blocked all lanes heading west out of Marysville into Tulalip. During 4th Street PM peak, traffic traveling in the eastbound direction on the inside lane leaving Tulalip was stop and go, and traffic on the inside lane heading westbound was stop and go and blocked lanes heading west out of Marysville into Tulalip. Traffic issues in the 88th Street NE corridor during weekday PM and Saturday afternoon peaks included long standing queues (Parametrix 2022b).

3.4.3 Environmental Consequences

Traffic volumes for the 88th Street NE and 4th Street corridors are expected to increase by 10 to 230 percent between 2019 and 2045. This increase has been projected for both the No Action alternative and Proposed Action.

Vehicles emit a variety of gases during their operation; some of these are greenhouse gases (GHGs). The GHGs associated with transportation are carbon dioxide (CO_2), methane, and nitrous oxide. Any process that burns fossil fuel releases CO_2 into the air. Carbon dioxide makes up the bulk of the emissions from transportation.

Under the No Action alternative, traffic flow is expected to worsen in both corridors. For example, the 2022 Intersection Control Evaluation projects a weekday PM peak delay would average about 50 seconds for the study intersections in the 88th Street NE corridor with a level of service (LOS) E and F[1] for several of the intersections. Several study intersections within the 4th Street corridor would be operating at a LOS D or F in 2025, with an average delay of about 94 seconds for all intersections (Parametrix 2022b). This would increase idling times for vehicles at the interchange, which would result in an increase in emissions including greenhouse gases, lowering the air quality in the area.

[1] Six LOS standards were applied to roadways with a letter grade of A, indicating the best traffic flow and corresponding traffic safety, through F, indicating the worst.

The Proposed Action would likely improve traffic flow, reduce stop-and-go conditions, and improve roadway speeds to a moderate level. For example, the 2022 Intersection Control Evaluation projects a weekday PM peak delay would average about 8 seconds in the 88th Street NE corridor, with a LOS of A for all study area intersections. All study intersections within the 4th Street corridor would be operating at a LOS A in 2025, with an average delay of about 6 seconds (Parametrix 2022b). This is an improvement to the current weekday PM peak delay that would be experienced, despite the projected increase of traffic volume. Improved traffic flow also has the potential for greater fuel efficiency through the reduction of idling and therefore less fuel use, which could reduce emissions that are released through extraction, refining, and transport of fuels utilized by motor vehicles traveling in the study area. This increase in traffic flow efficiency resulting from the Proposed Action could reduce GHG emissions and improve air quality in the area.

Construction greenhouse gas emissions are temporary and would originate from the fuel burned by construction equipment and from emissions caused by increased traffic congestion during construction activities. Construction would also result in fugitive dust.

3.4.4 Mitigation

Operationally, the Proposed Action is expected to reduce GHGs emissions. With appropriate implementation of a traffic control plan to minimize construction-traffic backups and implementation of construction BMPs (e.g., maintaining equipment, reducing idling, applying dust management control measures), additional mitigation is not required.

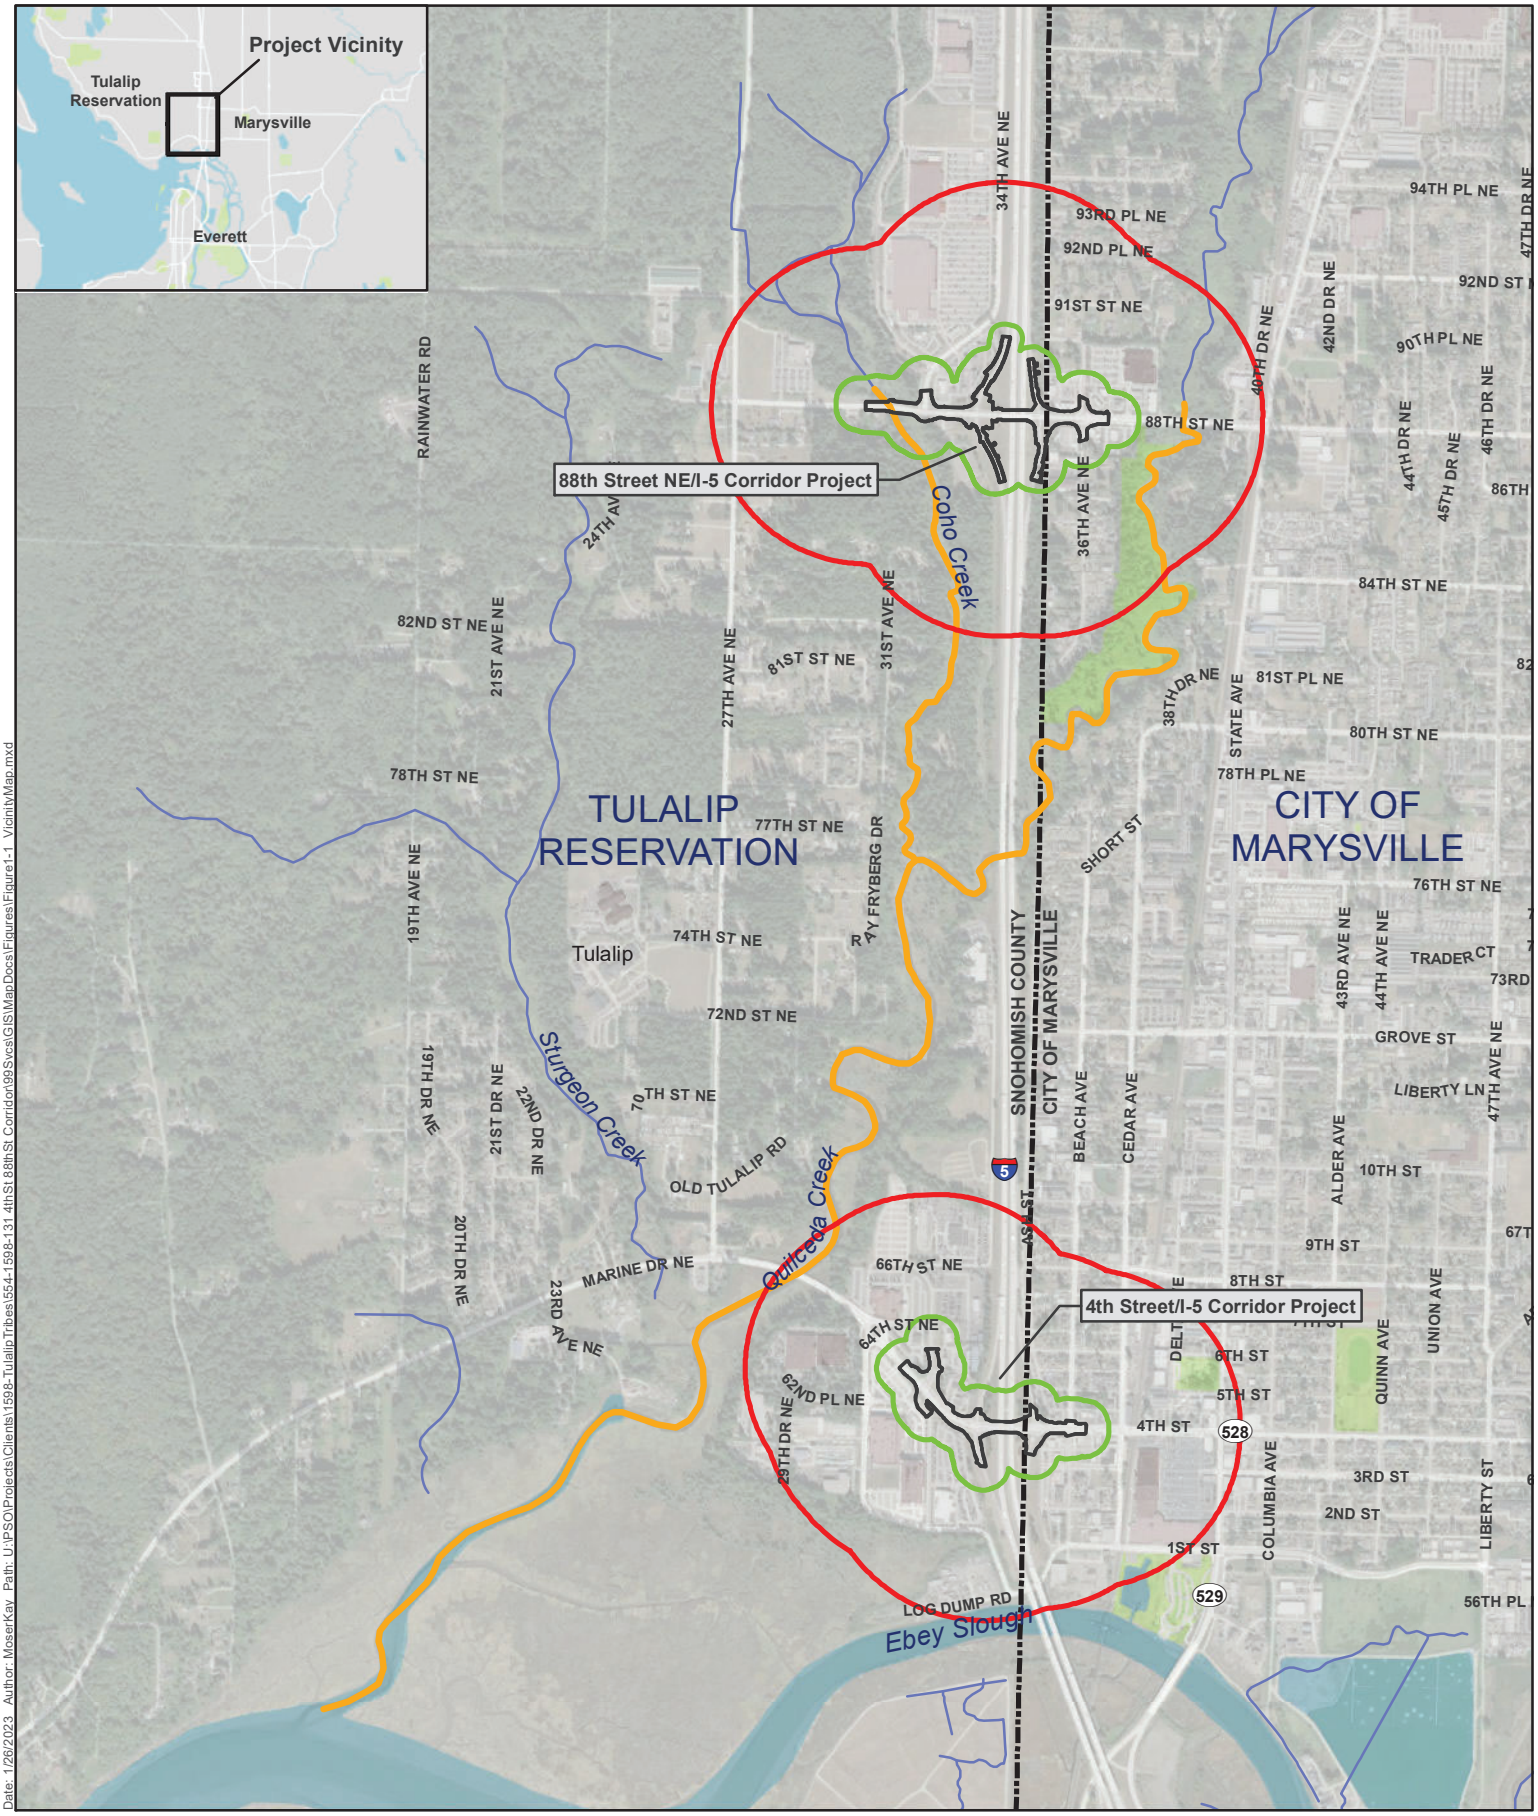
3.5 Living Resources

3.5.1 Data Collection and Analysis

The information for the Living Resources discussion was drawn from the Ecosystem Discipline Report (Parametrix 2022c) and the Biological Assessment (Parametrix 2022d) prepared on behalf of the I - 5/4th Street and 88th Street NE Corridor Improvements project. These documents are included in Appendix B and C, respectively. Refer to these documents for a better understanding of methods and assumptions.

3.5.2 Existing Conditions

The sections below summarize the following resources: aquatic, vegetation and wildlife, and wetland. Figure 3-4 provides an understanding of the study area for each resource.



Date: 1/26/2023 Author: MoserKav Path: U:\PSO\Projects\Clients\1598-TulalipTribes\554-1598-131 4thSt 88thSt Corridor\99Svcs\GIS\MapDocs\Figures\Figure1-1 VicinityMap.mxd

3.5.2.1 Aquatic Resources

This section summarizes aquatic habitats and species in the study area for the I-5/4th Street and 88th Street NE Corridor Improvements project. The study area occurs within two watersheds: the northern portion is in the Quilceda Creek watershed (hydrologic unit code [HUC] 171100110204), and the southern portion is in the Snohomish River-Frontal Possession Sound watershed (HUC 171100110203), north to south, respectively.

Streams

Three streams (Coho Creek, Quilceda Creek, and Ebey Slough) were identified within the aquatic resources study area. Coho Creek flows into Quilceda Creek, which drains into the Ebey Slough within the Snohomish River estuary system. Construction of a replacement bridge at 88th Street NE would entail work within Coho Creek. Quilceda Creek and Ebey Slough are included in the study area because they would receive stormwater runoff from impervious surfaces created or replaced by the project. The extent of the aquatic resource study area reflects the area where potential contaminants from stormwater outfalls may be expected to exceed background levels. The volume of water in Ebey Slough will dilute contaminants in stormwater to negligible almost immediately after treated stormwater enters the slough. Therefore, the aquatic resource study area terminates at the confluence of Quilceda Creek and Ebey Slough. Table 3-7 summarizes these streams. Figure 3-4 shows the location of the streams.

Table 3-7. Summary of Streams in the Study Area

Stream Name	State Interim Water Type[a]	Local Jurisdiction	Local Jurisdiction Stream Classification[b]	Local Jurisdiction Buffer Width (feet)[c]

[c] TTC 7.110.070

Fish and Other Aquatic Species

Fish species, including Chinook salmon, steelhead, bull trout, pink salmon, coho salmon, and chum salmon, use Ebey Slough primarily as a migration corridor and as a transition zone between marine and freshwater environments. Ebey Slough also provides rearing habitat and serves as a migratory corridor for juvenile salmonids. Quilceda Creek provides a migratory corridor and rearing habitat as well as limited-potential spawning habitat for Chinook salmon, steelhead, and other fish species. Although the number of Chinook salmon that spawn in use of Quilceda Creek is low compared to other systems, the population in that stream contributes to genetic diversity at a broader scale (Nelson 2022, personal communication) characterized as “relatively minimal” compared to Chinook use of the Snohomish River system (Quil Ceda Village 2009). This is likely attributable to the limited availability of suitable spawning substrates, which are not widely available in the Quilceda Creek watershed (Quil Ceda Village 2009).

Species of fish known to be present within the 88th Street NE project area along Coho Creek include coho salmon, chum salmon, and resident coastal cutthroat trout (NWIFC 2022; TTED 2021). Species that have

not been documented in the project area but have the potential to occur given suitable stream gradients include Chinook salmon, pink salmon, steelhead, and bull trout (NWIFC 2022).

Species of concern are defined as those with a regulatory status that prompt individual attention through federal, state, and/or local permitting processes. Resource analysts reviewed the Washington Department of Fish and Wildlife (WDFW) lists of state- and federally listed species as well as the lists of state priority species, species that are culturally important to the Tulalip Tribes, and identified aquatic species of concern that may use habitats in the study area, as described below.

Federal, State, and Culturally Important Aquatic Species

The ESA requires each federal agency (in this case, the BIA) to ensure that any actions it undertakes or approves do not jeopardize the continued existence of endangered or threatened species or result in the destruction or adverse modification of their designated critical habitat. To meet this requirement, BIA initiated consultation with the United States Fish and Wildlife Service (USFWS) and NMFS concerning the potential effects of the I-5/4th Street and 88th Street NE Corridor Improvements project on ESA-listed species and critical habitat. The Tulalip Tribes prepared a Biological Assessment to support ESA consultation (see Appendix C). The Biological Assessment analyzes the potential for the project to result in adverse effects on the following ESA-listed species and critical habitats in aquatic areas:

- Puget Sound Chinook salmon
- Puget Sound steelhead
- Bull trout
- Southern Resident killer whale
- Designated critical habitat for Puget Sound Chinook salmon
- Designated critical habitat for Puget Sound steelhead
- Designated critical habitat for bull trout

The Biological Assessment also supports consultation with NMFS about potential effects on essential fish habitat for federally managed commercial fisheries. The study area includes waters designated as essential fish habitat for Pacific salmon (Chinook, coho, and pink salmon), Pacific coast groundfish, and coastal pelagic species.

In addition to the ESA-listed species discussed above, other species that may use aquatic habitats in the study area have state listing status or are considered culturally important to the Tulalip Tribes. These other aquatic species that may use habitats in the study area include chum salmon, coho salmon, cutthroat trout, Pacific lamprey, pink salmon, rainbow trout, river lamprey, and Olympic mudminnow.

3.5.2.2 Vegetation and Wildlife Resources

The vegetation study area includes a variety of cover types and wildlife habitats. Much of the study area consists of urban development, primarily commercial land use. These areas support wildlife species adapted to disturbed urban areas. However, undeveloped habitat within the Coho Creek corridor supports a variety of vegetation types and wildlife species. Vegetation conditions and wildlife habitats are described in the following subsections.

Vegetation

The study area for vegetation is shown in Figure 3-4. Vegetation in the study area was evaluated for the presence of rare plants and priority ecosystems through a review of the Natural Heritage program database (WDNR 2022). There are no documented occurrences of rare plants or priority ecosystems within the vegetation study areas (extending 200 feet from the project footprints). The closest known rare plants and nonvascular species of high conservation value are mapped approximately 2,000 feet from the 4th Street project footprint, outside the study area for vegetation. These mapped plant species are not federally listed but do carry state sensitive and state threatened species status. Plants identified in the study area that are culturally important species to Tulalip Tribes include cedar and ironwood.

Eleven land cover types were identified in the study areas. Of the 83.2 acres of mapped land cover types, approximately 65 acres are categorized as developed, unvegetated surfaces or roadside ROW. The other predominant land cover types include riparian forest (approximately 3.6 acres), shrubland (approximately 1.9 acres), mown grass and landscaping (approximately 4.4 acres), and upland forest (approximately 2.5 acres).

Terrestrial Wildlife

Overall, the unvegetated/road, grassland, mown grass, and developed commercial areas are the dominant cover/habitat types in the wildlife study area and, as such, provide low to moderate habitat value for wildlife. The emergent wetland areas and riparian habitat in the Coho Creek and Quilceda Creek corridors and Ebey slough estuary wetland represent the higher-value cover and habitat types important for wildlife. The Quilceda Creek and Coho Creek corridors provide food, cover, and nesting for species, including bald eagle, great blue heron, red-tailed hawk, belted kingfisher, red-legged frog, and mule deer (eBird 2022).

The study area for potential disturbance of wildlife extends over Ebey Slough, which is part of the Snohomish River estuary. Numerous species of birds, amphibians, and mammals are known to occupy habitats within the Snohomish River estuary and use them for foraging, breeding, and nesting. Species migrating to nesting grounds in the north or overwintering areas in the south also use these habitats as rest areas.

Wildlife observed during field visits include species typically habituated to human activities, such as rock pigeons, house sparrows, American robins, American crows, dark-eyed juncos, and Northern flickers.

Federal, State, and Culturally Important Species

ESA-Listed Species

Based on reviews of information from the USFWS Information for Planning and Consultation website and guidance from WSDOT, analysts determined that the project has the potential to affect two ESA-listed species that may use terrestrial habitats in the study area. These species are the marbled murrelet and the Oregon spotted frog, both of which are listed as threatened. The study area includes some potential foraging habitat for marbled murrelets and potentially suitable breeding, rearing, overwintering habitat for Oregon spotted frogs (WDFW 2022; WSDOT 2015). The Biological Assessment that was prepared to support ESA consultation provides additional information (see Appendix C).

According to the USFWS Information for Planning and Consultation website, one additional ESA-listed species (yellow-billed cuckoo) and one species proposed for listing (North American wolverine) could potentially use habitats in the study area (USFWS 2023). Analysts reviewed the habitat requirements of

those species and determined that there is no potential for project-related impact on either species. In addition, no critical habitat for any ESA-listed species is present in the study area.

Migratory Birds

The Migratory Bird Treaty Act of 1918, administered by USFWS, makes it unlawful to take, import, export, possess, sell, purchase, or barter any migratory bird, with the exception of the taking of game birds during established hunting seasons. The term, *take*, in this context, includes mortality or capture of migratory birds that directly and foreseeably results from an action. Nearly all bird species that may occur in the study area are protected under the Migratory Bird Treaty Act. All habitats in the study area support migratory birds of some type at some time in their life cycle; therefore, all habitats identified above would be considered habitat for migratory birds.

Bald and Golden Eagles

The Bald and Golden Eagle Protection Act (16 U.S.C. §§ 668-668c) prohibits the take of bald or golden eagles, including their parts, nests, or eggs, unless allowed by a permit issued by the Secretary of the Interior (16 U.S.C. § 668(a); 50 CFR part 22). The Bald and Golden Eagle Protection Act and implementing regulations define take as "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest or disturb." Activities that disturb vegetation or generate noise or human activity near an active nest (generally, 660 feet or closer) may require an incidental take permit. No eagle nests have been identified within 660 feet of the project footprint.

Other Wildlife Species of Concern

In addition to the ESA-listed species discussed above, 27 species that may use terrestrial habitats in the study area have state-listing status or are considered culturally important to the Tulalip Tribes. Animal species identified as culturally important to the Tulalip Tribes include fish, eagles, hawks, falcons, owls, deer, and bears (TTC 7.110.020). The complete list of species by type, status, and habitat use in the study area is provided in the Ecosystem Discipline Report (Appendix B).

3.5.2.3 Wetlands

One wetland (Wetland A) was identified in the 88th Street NE area, and none were identified within the 4th Street study area. Wetland A is located within the Coho Creek riparian corridor west of I-5 in the 88th Street NE project footprint. The mapped location of the wetland and the delineated boundaries are shown in the Ecosystem Discipline Report (Appendix B). A summary of wetland characteristics is included in Table 3-8 below.

Table 3-8. Summary of Wetlands in the Study Area

3.5.3 Environmental Consequences

This section summarizes the temporary and permanent effects of the No Action alternative and the Proposed Action for the I-5/4th Street and 88th Street NE Corridor Improvements project on the following resources:

- Aquatic Resources
- Vegetation and Wildlife Resources
- Wetland Resources

The Ecosystem Discipline Report (Appendix B) provides greater detail.

3.5.3.1 Aquatic Resources

This section emphasizes effects on aquatic resources, including ESA-listed threatened and endangered species, with some discussion of proximal impacts on wetlands associated with stream realignment.

No Action Alternative

Permanent and Temporary Impacts

Under the No Action alternative, there would be no project-related changes to the current water quality or hydrology of Coho Creek or the riparian corridor. No potential temporary or permanent degradation of water quality (such as sedimentation, turbidity, or toxicants) would occur, and there would be no additional stormwater inputs to streams. There would be no potential for fish mortality resulting from fish exclusion work. The stream would remain in its current alignment and conveyance through an undersized culvert. There would be no potential for fish passage improvement or the creation of additional riparian habitat in place of the existing undersized culvert and roadway fill prism. Access by fish to restored sections of Coho Creek upstream of the project area would remain uncertain. No in-stream or riparian improvements, including invasive species removal and large woody material placement, would occur.

Proposed Action

Permanent Impacts

Under the Proposed Action, realigning the stream channel and building bridge piers and retaining walls would entail the placement of fill (0.02 acre) below the ordinary high water line (OHWL) of Coho Creek. The impacts of aquatic habitat loss in these areas would be offset by (1) the creation of new stream channel habitat combined with (2) the removal of the gabion-supported road fill prism that currently occupies areas that would otherwise be within the OHWL of Coho Creek and/or within associated wetland and riparian areas. The anticipated temporary and permanent impacts of the Proposed Action on Coho Creek and its associated buffers are identified in Table 3-9.

Table 3-9. Summary of Temporary and Permanent Impacts on Coho Creek (in acres)

Stream	Permanent Impact	Temporary Impacts	Aquatic Conversion Area[1]	Permanent Buffer	Temporary Buffer
Coho Creek	0.02	0.09	0.01	0.32	0.23

[1] This area includes existing stream habitat converted to wetland and is considered self-mitigating after stream restoration construction work is complete.

All impacts to wetlands, streams, and their regulatory buffers would be mitigated in accordance with applicable tribal, federal, state, and local requirements. There would be no net loss of wetland or stream area or ecological functions. The project is expected to result in a substantial improvement in system processes and ecological functions of wetlands and streams after fill removal associated with the bridge construction.

The stormwater design employs underground stormwater treatment vaults to remove contaminants (including 6PPD-quinone, petrochemicals, and metals) before runoff enters surface waters or aboveground stormwater facilities (e.g., bioswales, infiltration ponds). Implementation of these practices, combined with an overall reduction in the amount of PGIS, is expected to reduce the potential for aquatic species to be exposed to elevated concentrations of pollutants (including dissolved metals and other chemical contaminants) in runoff from impervious surfaces created or replaced by the project. Even with these measures, it is possible that some residual contaminants may be present in runoff that leaves the project area. These contaminants may be toxic to fish and other aquatic species.

Based on the potential for exposure to residual contaminants in stormwater runoff, the Biological Assessment includes determinations that the project is likely to adversely affect Puget Sound Chinook salmon, Puget Sound steelhead, designated critical habitat for both species, and essential fish habitat for Pacific salmon (see Appendix C). Given the low likelihood of bull trout being present in stream habitats in the study area, the Biological Assessment determined that the project is not likely to adversely affect bull trout. In addition, the Biological Assessment found that the project is not likely to adversely affect Southern Resident killer whales and that it will not adversely affect essential fish habitat for groundfish or coastal pelagic species. The Biological Assessment identifies performance standards and additional measures to avoid, minimize, and mitigate potential impacts on ESA-listed species and critical habitats (see Appendix C). It is possible that additional measures may be identified through the ESA consultation process.

Removal of the undersized culvert may reduce the amount of area affected by backwatering during high-flow events in Coho Creek. Based on low gradients, abundant beaver activity, and groundwater availability in Wetland A upstream of 88th Street NE, this change would not be expected to affect the hydrology of Wetland A. Modeling indicates that the project would not affect the water surface elevation in Coho Creek during a 2-year storm event. Measurable changes in water surface elevations would occur only during significantly larger storm events, which do not play a major role in determining wetland hydrology (Parametrix 2022c). For these reasons, the total area of Wetland A is not expected to change. Over the long term, the proposed habitat improvements in Coho Creek would benefit aquatic species by increasing the amount of available habitat, improving habitat complexity, maintaining riparian cover and water quality, and increasing the prey base.

Greater detail regarding the offsets and uplifts to habitat are described in the Ecosystems Discipline Report (Appendix B).

Temporary Impacts

Bridge construction (including construction of a temporary access road at the bridge site) and stream channel realignment would entail clearing vegetation in the riparian zone along Coho Creek. Under current conditions, vegetation in the affected areas consists primarily of invasive species such as Himalayan blackberry and reed canarygrass. Temporarily disturbed areas in the riparian zone would be replanted with native species that support riparian ecological functions. The removal of invasive vegetation and replanting with appropriate native species would likely contribute to improved riparian habitat quality over time. In addition, as mentioned above, approximately 0.13 acre of gabion-supported

road fill prism would be replaced with native soils and native vegetation, increasing the amount of area that provides riparian ecological functions.

Safety standards require that only low-stature species be allowed to grow within 10 feet of the new bridge. Mature forest habitat would not develop in those areas, reducing the potential for recruitment of large woody material to the stream over the long term. This reduction would be offset by the placement of more than 60 pieces of large woody material in and near the stream as part of the project design.

The Proposed Action would include the temporary disturbance of soils during grading and excavating activities. Site grading and excavating could result in erosion from disturbed upland soils, potentially increasing the sediment load in runoff entering Coho Creek. Stream reconstruction activities in Coho Creek may mobilize existing bottom sediments and sediments within the existing culvert, leading to short-term increases in turbidity and sedimentation of downstream areas. Based on the implementation of site-specific BMPs, the effects of sedimentation and turbidity in Coho Creek are anticipated to be minimal. All construction activities below the OHWL of Coho Creek would occur during the in-water work window established by the Tribes (July 15 through September 30). No in-water work would be performed outside that window without prior review and approval by Tulalip Tribal staff. In the unlikely event that Chinook salmon, steelhead, or bull trout spawn in Coho Creek, this work would take place when migrating adults, incubating eggs, and outmigrating juveniles are least likely to be present. In addition, any fish exclusion work would be performed in compliance with applicable fish exclusion protocol and standards (e.g., WSDOT 2021; USFWS 2012). No work within Quilceda Creek or Ebey Slough is anticipated.

3.5.3.2 Vegetation and Wildlife Resources

No Action Alternative

Permanent and Temporary Impacts

Under the No Action alternative, there would be no temporary or permanent project-related impacts to existing vegetation and wildlife habitats. There would be no conversion of vegetated areas to impervious surfaces and no impacts to significant trees. There would be no changes to trees and shrubs within the riparian corridor of Coho Creek. Patches of invasive Himalayan blackberry along the existing roadway fill prism would not be removed for project construction.

Proposed Action

The analysis considered the following potential impacts on vegetation and wildlife resources under the Proposed Action:

- Permanent impacts associated with the clearing and paving of vegetation and wildlife habitats
- Temporary impacts associated with clearing and staging of equipment
- Permanent and temporary impacts to significant trees in the study area
- Impacts to life cycle habitat for animals and/or plants considered culturally important to the Tulalip Tribes, as listed under TTC 7.110.020
- Effects on ESA-listed species

Construction of the corridor improvements project would result in temporary and permanent impacts to vegetation and wildlife within the vegetation study area. Table 3-10 below summarizes the impacts for each vegetation cover type. A total of 29 significant trees would be removed within the study area

(14 trees within permanent impact areas and 15 within temporary impact areas).[2] Twenty-two of these trees are within the Tulalip Reservation and seven are within the City of Marysville. The Ecosystem Report provides a detailed characterization of the vegetation that would be permanently and temporarily affected by the Proposed Action (Appendix B). The following sections summarize the permanent and temporary impacts for each corridor followed by a summary of the findings related to ESA-listed species.

Table 3-10. Summary of Temporary and Permanent Impacts on Vegetation and Wildlife Habitats (in acres)

	4th Street Portion of Study Area		88th Street NE Portion of Study Area		Total Project Impacts	
Cover/Habitat Type	Permanent Impact Area	Temporary Impact Area	Permanent Impact Area	Temporary Impact Area	Permanent Impact Area	Temporary Impact Area
Emergent Wetland	0.00	0.00	0.04	0.04	0.04	0.04
Scrub-Shrub Wetland	0.00	0.00	0.04	0.05	0.04	0.05
Stream Channel	0.00	0.00	0.02	0.02	0.02	0.02
Riparian Forest	0.00	0.00	0.01	0.03	0.01	0.03
Upland Forest	0.13	0.08	0.14	0.09	0.27	0.17
Shrubland	0.00	0.01	0.47	0.40	0.47	0.41
Mown grass and Landscaping	0.12	0.05	0.45	0.34	0.57	0.39

Stormwater Facilities	0.00	0.05	0.08	0.07	0.08	0.12
Residential	0.00	0.00	0.00	0.00	0.00	0.00
Developed Unvegetated Surfaces	4.61	0.57	6.02	0.64	10.63	1.21
TOTAL	**6.44**	**1.38**	**8.69**	**2.50**	**15.13**	**3.88**

Permanent Impacts

For both 4th Street and 88th Street NE corridors, vegetated areas make up a small portion of the cover in the permanent impact area. Vegetation that would be affected consists primarily of the disturbed roadside ROW cover type, with smaller amounts of upland forest and mown grass/landscaping. Affected upland forest vegetation consists primarily of conifer trees near the I-5/4th Street interchange and directly east of I-5 adjacent to commercial businesses. These trees may provide structural habitat for birds and other wildlife, but the trees are in an area that is highly disturbed due to the proximity to major highways and roads. The 88th Street NE corridor includes other cover types that would be permanently impacted, including emergent wetland, scrub-shrub wetland, stream channel, upland forest, shrubland, mown

[2] The City of Marysville defines significant trees as evergreen trees with a diameter of 8 inches, as measured 4 feet above grade, and deciduous trees with 12-inch diameters (MMC 22A.020.200). The Tulalip Tribal Code does not include definitions for significant trees. Therefore, all trees greater than 8 inches as measured 4 feet above grade were identified as significant trees within the Study Area.

grass/landscaping, and stormwater facilities. Impacts to areas classified as stream channel and wetland would be mitigated in accordance with applicable tribal, federal, state, and local requirements.

The Biological Assessment prepared to support ESA consultation for this project includes determinations that the project is not likely to adversely affect marbled murrelets or Oregon spotted frogs (see Appendix C). The Biological Assessment identifies performance standards and additional measures to avoid, minimize, and mitigate potential impacts on those species and their habitat.

Temporary Impacts

Project construction would require clearing and removing vegetation in the temporary impact area. Outside of areas where roadside vegetation maintenance standards require the planting of grasses or other low-growing species, temporarily disturbed areas would be replanted with native species. Temporary staging areas would be located within previously developed areas (roads) and would not require vegetation clearing.

Most of the land cover in the temporary clearing area in the 4th Street and 88th Street NE portions of the study area consists of developed unvegetated surfaces or roadside ROW vegetation (see Table 3-10). In addition, the 88th Street NE corridor includes other cover types in the temporary impact area, such as emergent wetland, scrub-shrub wetland, stream channel, riparian forest, upland forest, shrubland, mown grass/landscaping, and stormwater facilities. Two significant trees (red alders) in the riparian buffer are also present in the temporary disturbance area and would likely be removed.

Construction activities would temporarily affect wildlife in and near the project site. Impacts would occur from vegetation and habitat loss, disruption of travel corridors, noise impacts, and displacement of wildlife into potentially less suitable habitats where they might not thrive. Wildlife would likely be displaced when construction begins. Species displaced by construction noise would likely return after construction is complete. However, reestablishing native vegetation would require months to years for herbaceous upland and wetland types and years to decades for forests.

3.5.3.3 Wetland Resources

No Action Alternative

Permanent and Temporary Impacts

Under the No Action Alternative, there would be no permanent or temporary project-related impacts to wetlands in the study area. The vegetation and hydrology conditions would remain the same, and wetland soils would remain intact. There would be no improvements to habitat structure within Wetland A. There would be no potential for the creation of additional wetland and riparian habitat area in place of the existing roadway fill prism.

Proposed Action

Permanent and Temporary Impacts

Approximately 0.09 acre of Wetland A would be affected by fill placement, and 0.01 acre of the wetland would be affected by aquatic area conversion associated with stream realignment. However, approximately 0.14 acre of gabion-supported road fill prism would be removed, replaced with native soils, graded to meet wetland and OHWL elevations, and restored with native vegetation. Over time, this area is expected to support wetland and riparian functions, potentially resulting in a net increase of approximately 0.05 acre of wetland area at the project site.

Permanent and temporary impacts to wetlands resulting from construction of the corridors improvement project are listed in Table 3-11.

Table 3-11. Temporary and Permanent Impacts to Wetlands and Their Buffers

Wetland	Vegetation Type	Permanent Impacts	Temporary Impacts	Aquatic Conversion Area[3]	Permanent Buffer Impacts	Temporary Buffer Impacts
A	PSS/PEM	0.08[1]	0.09[2]	0.01	0.32	0.23

PEM = palustrine emergent; PSS = palustrine scrub-shrub

1 This total includes 0.02 acre of wetland below the OHWL; therefore, it is also considered a stream impact and is included in Table 3-9.

2 This total includes 0.09 acre of wetland below the OHWL; therefore, it is also considered a stream impact and is included in Table 3-9.

3 This area consists of existing wetland habitat converted to stream and is considered self-mitigating after stream restoration construction work is complete.

3.5.4 Mitigation

As discussed above, the project is expected to result in no net loss of wetland or stream area, and it may result in a net gain of approximately 0.05 acre of wetland habitat. In addition, the project is expected to provide a net gain in the ecological functions of Coho Creek and associated wetlands. In addition to improving fish access, adding large woody material and replacing the gabion-supported road prism with native riparian vegetation, the project would have the following beneficial effects:

- Increased availability of potentially suitable spawning substrates in the newly constructed stream channel
- Improved connectivity between the stream and its floodplain where the existing gabion-supported road fill prism is removed
- Improved movement of sediments through the system due to stream channel realignment and removal of the undersized culvert

Impacted riparian areas coincide with impacted wetland buffer areas. For this reason, all buffer impacts (i.e., impacts to stream buffers and to wetland buffers) are referred to as impacts to riparian areas. All temporarily impacted riparian areas (totaling 0.23 acre) would be restored in place with native woody vegetation after project construction is complete. These areas are currently dominated by invasive species that support fewer ecological functions than the native woody species that would be used for site restoration.

Compensatory mitigation would be provided for all permanently impacted riparian areas. Several riparian habitat mitigation areas have been identified in the project vicinity. Currently these areas are dominated by invasive species such as knotweed and Himalayan blackberry. Mitigation would consist of removing the invasive species and replanting the areas with a variety of native trees and shrubs that support riparian functions and offer increased plant diversity for wildlife. The total extent of permanent riparian impacts is 0.32 acre, and the combined size of the riparian habitat mitigation areas is 0.48 acre. The project would thus achieve a mitigation ratio of 1.6:1 for riparian impacts, exceeding the guideline of a 1:1 mitigation ratio.

The Proposed Action is being designed to comply with all federal, state, and local regulations. The mitigation approach is also being coordinated with Tulalip tribal biologists. The project would use a mitigation sequencing approach based on a hierarchy of avoiding and minimizing adverse impacts

through careful design, implementing BMPs, and rectifying temporary impacts. Applicable BMPs would be implemented during project construction and operation.

3.6 Cultural Resources

3.6.1 Data Collection and Analysis

Cultural resource data collection and analysis for this project involved the following activities:

- Literature review of site forms and previous cultural resources reports on file at the Washington State Department of Archaeology and Historic Preservation (DAHP)
- Review of relevant environmental, historic, ethnographic maps and documentation
- Definition of the Area of Potential Effect (APE) through coordination with project engineers and the tribe
- Coordination with Tulalip Tribes cultural representatives to determine if the Tribe had any specific information on cultural resources in the project vicinity and to coordinate field work
- Field investigation of the site, including a pedestrian survey and 12 shovel probes
- Historic property inventory, archaeological site recordation

The summary of existing conditions, potential impacts, and mitigation are based on a Cultural Resource Assessment prepared by ASM Affiliates that addressed the consultation requirements of Section 106 of the National Historic Preservation Act (NHPA) (ASM 2022). Consultation correspondence is provided as Appendix D.

3.6.2 Existing Conditions

The project area lies within the traditional territory of the Northern Lushootseed-speaking Snohomish. The Snohomish occupied numerous villages in the project vicinity. Historic development in the project vicinity included logging activities and transportation-related construction. The approved APE is shown in Figure 3-5.

3.6.2.1 4th Street

The APE in the vicinity of 4th Street is situated on the delta of the Snohomish River, near the mouth of Quilceda Creek. Although the subject of numerous previous cultural resource studies, no previously recorded cultural resources are documented within the APE. As described in these previous studies, the ground surface in this area has been extensively disturbed. No additional field survey was completed in this area, based primarily on the extent of asphalt and concrete covered surfaces in the APE. Although the area is highly disturbed, there is a possibility that additional cultural resources exist within the 4th Street APE for the following reasons:

- Influence of river delta deposition of extensive alluvium
- Probability models provided by the Washington Department of Historic Preservation (DAHP) that document the landform at high risk for containing material
- Representative documented sites on the same landform
- Ethnographic utilization of the same landform

- Identification of precontact lithic material during previous archaeological monitoring within the current APE
- Concerns voiced by the Tulalip Tribes cultural resource representatives

One historic property, the Marysville Opera House, is 100 meters east of the APE.

3.6.2.2 88th Street NE

The APE in the vicinity of 88th Street is generally located between Quilceda Creek and Coho Creek. Although multiple precontact archaeological sites occur in the project vicinity, no documented sites occur within the APE. However, based on the landform and absence of extensive archaeological work in the area, field survey was completed in conjunction with the Section 106 process to further assess existing conditions. Although no buried cultural resources were identified, there is a possibility that additional cultural resources exist within the 88th Street APE for the following reasons:

- Location within the Quilceda Creek floodplain
- Probability models provided by DAHP that document the landform at high risk for containing material
- Ethnographic utilization of the same landform
- Lack of previous cultural resource investigations
- Concerns voiced by Tulalip Tribes cultural resource representatives

Two historic cemeteries occur within 500 meters of the APE.

Figure 3-5.
I-5/4th Street and 88th Street NE
Corridor Improvements Project APE

3.6.3 Environmental Consequences

No impacts would occur to cultural resources under the No Action alternative.

In both areas of the APE (4th Street and 88th Street NE corridors), there remains a high probability that cultural resources could be encountered and impacted during ground-disturbing construction activities associated with the Proposed Action.

The historic property resources identified in the project vicinity would be unlikely to be impacted by the Proposed Action.

3.6.4 Mitigation

No mitigation is needed for the No Action alternative.

Under the Proposed Action, a project-specific monitoring and treatment plan would be prepared in accordance with BIA requirements. Archaeological monitoring of all ground disturbance within the project APE would be provided.

3.7 Environmental Justice

3.7.1 Data Collection and Analysis

Executive Order (EO) 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directs federal agencies to take appropriate and necessary steps to identify and address disproportionately high and adverse effects of federal projects on the health or environment of minority and low-income populations to the greatest extent practicable and permitted by law. Demographics for the Project study area were assessed using the Environmental Protection Agency's (EPA's) environmental justice tool (EPA 2022). The study area includes 11 census block groups within 0.5 mile of the project area (Figure 3-6).

3.7.2 Existing Conditions

Within 0.5 mile of the study area, 11 block groups have been identified, as shown in Figure 3-6. As shown in Table 3-12, of those block groups, four had populations with higher percentages of people of color than Washington State. Of these four block groups, three are not in the immediate project vicinity, and the fourth is a large block group with residential areas not in the immediate project vicinity. Seven block groups also had relatively higher low-income populations when compared to Washington State. Of these seven block groups, five are not in the immediate project vicinity. None of the 11 block groups had relatively higher linguistically isolated populations compared to the state. Additional demographic data is provided in Appendix E.

530619400014	1,869	19%	15%	0%

Source: EPA 2022

Additionally, 7 out of the 11 block groups have a higher percent population with less than high school education than the state. Five out of the 11 block groups have a higher percentage population over 65 years old as compared to the state.

3.7.3 Environmental Consequences

The No Action alternative would have no direct impact on minority, low-income, or linguistically isolated populations. However, with the No Action alternative, traffic is forecasted to increase over the next 20 years, leading to higher impacts on air quality and travel within the area. The increase in traffic and delays in travel would have significant impacts on the ability for emergency vehicles to reach populations and on the general ability of populations to travel with ease around their living area.

The Proposed Action would have no adverse impacts on minority, low-income, or linguistically isolated populations within the project area. Since the project would occur in an existing corridor, there is no potential for community fragmentation. Additionally, the project area is not within the vicinity of residential areas. The Proposed Action would have a positive impact due to the decrease in traffic delays through the area. There would be an increase in air quality over time and an increase in access to public services.

Under the Proposed Action, construction of corridor improvements would cause temporary traffic delays and some congestion for people moving through the area. Construction is expected to last 2.5 years. During that time, ongoing disruptions could include lane reductions, temporary signals, and bus stop relocations on 4th Street and 88th Street NE. In addition, there could be shorter term (e.g., days or weeks) closures and detours. Throughout construction, the construction contractor would be required to maintain business and pedestrian access. Construction timing and sequencing would be subject to additional provisions intended to keep vehicular traffic, pedestrians, and buses moving, as determined by the Tribes, the Washington State Department of Transportation, Snohomish County, and the City of Marysville. These

potential construction impacts would not disproportionately affect minority, low-income, or linguistically isolated populations within the project area.

Under the Proposed Action, businesses and some residential dwellings in the area could experience construction noise resulting from activities such as grading, excavation, pavement grinding and cutting, and drilling of bridge shafts.

3.7.4 Mitigation

No mitigation is proposed for the No Action alternative or for operational impacts under the Proposed Action. As described in Section 3.9.3, construction impacts related to traffic delays and congestion would be mitigated through the submittal and approval of Traffic Control Plans.

3.8 Community Services and Utilities

3.8.1 Data Collection and Analysis

This section discusses how community services and utilities could be affected by the project.

The community services study area is the area 0.5 mile from the potential construction limits of the 4th Street and 88th Street NE project corridors. The study area includes the jurisdictions of the Tribe and the City of Marysville. The public services analysis was conducted to identify what could cause changes in response times for emergency services (fire, medical, and police), travel times for school bus and solid waste collection routes, and overall demand for public services. Acquisition and displacement data were also reviewed to see whether any public services facilities would be acquired or whether emergency access would be interrupted.

The utilities study area is the construction limits of the 4th Street and 88th Street NE project areas. Analysis of utilities involved reviewing design drawings and construction documentation.

3.8.2 Existing Conditions

3.8.2.1 Community Services

The summary of existing community services is based on information from the Tribes' website (Tulalip Tribes 2022) unless specifically cited from another source. The community services discussed here include the following: fire, police, solid waste, transit, public works, and schools. All services are likely to travel through the project area to provide services to the Tulalip Tribe, the City of Marysville, and surrounding areas.

The Snohomish County Fire District 15 (Tulalip Bay Fire Department) encompasses the northern half of the Tulalip Reservation, including the project area. The Tulalip Bay Fire Department provides emergency medical services, fire, water rescue, wildland fire, fire inspections, and code enforcement within their jurisdiction. The department receives about 1,000 calls per year and operates out of one station. The station has two engines, two aid cars, one boat, a bush truck, and a tender (water taker). It is staffed by three full time captains and 24 volunteer fire fighters/emergency medical technicians (EMTs).

The project area is within the Tulalip Tribal Police Services jurisdiction. Tulalip Tribal Police Department patrols tribal villages, surrounding communities, and the City of Quil Ceda, including the project area. It is staffed by 18 uniformed officers, investigators, and Fish and Wildlife staff and receives approximately

24,000 calls a year, of which approximately 530 calls are from neighboring agencies. The Tulalip Tribal Police Department is in the Tulalip Reservation at 6332 31st Avenue NE, about 0.15 miles west of the 4th Street corridor project area. The project area is also within the City of Marysville Police Jurisdiction. The Marysville Police Department is supported by 109 personnel, including 77 uniformed officers and 39 non-uniformed personnel, and received 64,355 calls for service in 2021 (Marysville Police Department 2021). Finally, the study area is also served by Washington State Patrol Field Operation Bureau District 7, which is responsible for traffic law enforcement, collision investigation, motorist assists on I-5 (WSP 2023).

Solid waste treatment; snow and ice removal; storm water drainage; and construction and maintenance of roadways, ditches, detention ponds, sidewalks, and signs are all provided by Tulalip Public Works, City of Marysville Public Works, and WSDOT roadside maintenance division.

Transit is provided by Community Transit and Tulalip Transit. Tulalip Transit provides rural public transit to areas within the reservation not currently served by Community Transit. For information on Transportation Services see Section 3.9.

Marysville School District No. 25 provides public education for children in the community. Schools that serve the project area include Quil Ceda Tulalip Elementary and the Marysville Tulalip Campus, which provides middle and high school, including Legacy High School, Heritage High School, 10th Street Middle School; and Totem Middle School. Totem Middle School, the only school physically located in the study area, is in the City of Marysville at 1605 7th Street, about 0.30 miles northeast of the 4th Street corridor project area. Additionally, there is a Boys and Girls Club that provides after-school care and extracurricular activities to children in the area. The Boys and Girl Club is in the City of Marysville at 1010 Beach Avenue, about 0.30 miles north of the 4th Street corridor project area. (Marysville School District 25 2022).

3.8.2.2 Utilities

Numerous above and below ground utilities are located within the ROWs for both 88th Street NE and 4th Street. The underground utilities include gas, power, water, telephone, sanitary sewer and storm sewer. Power is the primary above-ground utility. Associated utility infrastructure, such as poles, manholes, vaults, meter boxes, and valves, is in or close to the road ROWs.

3.8.3 Environmental Consequences

3.8.3.1 Communities Services

The No Action alternative would have no direct impact on the community infrastructure in the Project area. However, with the projected traffic increase within the project area, emergency response times could be increased, and the community could experience delays reaching community services and facilities, both within and outside the study area.

The Proposed Action would not have a direct impact on community infrastructure, and would improve traffic flow in the project area. This would have an indirect effect of improving emergency response time. Travel to community services and facilities, both within and outside the study area, would also be more efficient for members of the community.

3.8.3.2 Utilities

The No Action alternative would not have direct impacts on the utilities.

Under the Proposed Action, in general, as the corridor improvements are constructed, some of the utilities within the road ROWs could require temporary protection or permanent relocation. At the Coho Creek, where a bridge would replace the existing culvert, underground utilities would either be protected in place or relocated to suspend between the new bridge girders.

Above-ground power lines that are left in place could interfere with construction equipment, such as cranes and drill rigs. This type of equipment typically needs to maintain a minimum 15- to 25-foot distance from overhead power lines to operate safely. This distance could be reduced, however, if the power lines are temporarily deenergized. It has not yet been determined whether the power lines could be deenergized.

3.8.4 Mitigation

No mitigation proposed.

3.9 Transportation Networks

3.9.1 Data Collection and Analysis

The summary of transportation networks is based on the 2022 Non-Access Feasibility Study (Parametrix 2022a) and the 2022 Intersection Control Evaluation (Parametrix 2022b). The study area for the Non-Access Feasibility Study was broad, analyzing 12 intersections (6 along each corridor), in conjunction with alternative screening, as described in Section 2.4. Based on that screening, the study area for the intersection control evaluation narrowed to the seven intersections described in Section 3.4.1 Air Quality and Greenhouse Gas Emissions.

3.9.2 Existing Conditions

The interchange of I-5 with 4th Street/SR 528/Marine Drive NE is a diamond interchange with signalized intersections at the ramp termini. Fourth Street is designated as a principal arterial east of I-5 and a minor arterial west of I-5. 33rd Avenue NE is an assumed collector road that intersects 4th Street west of I-5. Both 4th Street and 33rd Avenue NE have speed limits of 25 miles per hour (mph). The I-5 northbound and southbound ramps have speed limits of 50 mph.

The interchange of 88th Street NE with I-5 is also a diamond interchange with signalized intersections at the ramp termini. A principal arterial east of I-5 and a minor arterial west of I-5, 88th Street NE has a speed limit of 35 mph. East of I-5, 36th Avenue NE intersects 88th Street NE and 34th Avenue NE intersects 88th Street NE west of I-5. Both are assumed collector roads and have speed limits of 25 and 30 mph, respectively. The I-5 northbound and southbound ramps have speed limits of 40 mph.

Both interchanges and connecting roadways are critically important to the surrounding community and Tribes for access to major retail services and for access to the reservation because the only other access to the reservation is through 140th Street NE, a county road at the northern end of the reservation, or through water access via the Puget Sound or the Snohomish River (Parametrix 2022b). This access is vital for goods, services, healthcare, employment, education, and economic development within the project area.

I-5 is a major freight network and is affected by congestion spillover from the 4th Street and 88th Street NE interchanges, which hinders freight, commerce, and international trade with Canada.

Pedestrian and bicycle travel is limited at both interchanges. At the 88th Street NE corridor, there are sidewalks along both sides of Quil Ceda Boulevard and 36th Avenue NE and along the north side of 88th Street NE from Quil Ceda Boulevard to east of 36th Avenue NE. Along the 4th Street corridor, there are sidewalks along both sides of 27th Avenue NE, 31st Avenue NE, 33rd Avenue NE, Cedar Avenue, and parts of 4th Street. Between 27th Avenue NE and 31st Avenue NE, there is only a sidewalk available on the north side of 4th Street. There are no designated bike lanes. The 2019 Existing Conditions Study showed between 0 to 35 pedestrians and five or fewer bicyclists during peak hours at intersections in the study area.

Public transit is provided by Community Transit in the Project area and includes several bus stops along both interchanges. Routes 209 and 222 provide service every 60 minutes on weekdays and weekends, routes 421, 422, and 821 near the 4th Street Interchange provide frequent all-day service on weekdays only and are geared towards commuters. The 4th Street Interchange has two park-and-rides within a 0.5-mile radius of the Project area: Marysville I Park and Ride and Marysville Ash Avenue Park and Ride. Transit routes and service are detailed in Table 3-13 below.

Table 3-13. Community Transit Schedules within the Project Area

Bus Route	Weekday Operational Hours	Weekend Operational Hours	Route
		88th Street NE Interchange	
209	5:20 a.m. to 9:36 p.m., every 60 minutes	Saturday: 7:01 a.m. to 9:04 p.m., every 60 minutes Sunday: 8:01 a.m. to 8:03 p.m., every 60 minutes	Between Smokey Point and Lake Stevens
222	5:42 a.m. to 7:49 p.m., every 60 minutes	Saturday: 6:03 a.m. to 9:18 p.m., every 60 minutes Sunday: 7:24 a.m. to 7:24 p.m., every 60 minutes	Between Marysville and Tulalip
		4th Street/SR 528/Marine Drive NE Interchange	
209	5:32 a.m. to 9:27 p.m., every 60 minutes	Saturday: 6:52 a.m. to 9:32 p.m., every 60 minutes Sunday: 7:52 a.m. to 8:17 p.m., every 60 minutes	Between Smokey Point and Lake Stevens
222	5:55 a.m. to 8:03 p.m., every 60 minutes	Saturday: 6:17 a.m. to 8:25 p.m., every 60 minutes Sunday: 7:17 a.m. to 7:40 p.m., every 60 minutes	Between Marysville and Tulalip
227	4:30 a.m. to 4:25 p.m. every 60minutes, in the peak direction	No Weekend Service	Arlington to Seaway Transit Center
421	4:36 a.m. to 6:50 p.m., every 30 minutes in the peak direction	No Weekend Service	Between Marysville and Downtown Seattle
422	5:45 a.m. to 6:23 p.m., every 30 minutes in the peak direction	No Weekend Service	Between Stanwood and Downtown Seattle
821	4:55 a.m. to 6:28 p.m., every 20 minutes in the peak direction	No Weekend Service	Between Marysville and Northgate Station

Source: Community Transit 2022

3.9.3 Environmental Consequences

3.9.3.1 Operational Impacts

The No Action alternative would result in the continued delay of traffic at both interchanges, resulting in the hinderance of commuters, residents, visitors, freight, transit, pedestrians, and bicycles through the area. It would also allow the continued spillover of ramp traffic onto I-5, which could cause delays to the I-5 mainline traffic. Per the 2022 Intersection Control Evaluation (Parametrix 2022b), traffic flow delays are expected to increase dramatically by 2045, increasing from an average of 25 and 31 seconds at 88th Street NE and 4th Street, respectively, to 50 and 94 seconds during the weekday peak hours.

The Proposed Action would benefit the project area. Among these benefits, the Proposed Action would increase the flow of traffic, which is forecasted to have a 4 and 6 second delay at 88th Street and 4th Street, respectively, by 2045. Additionally, the Proposed Action would increase safety for both interchanges, improve business and residential community access by reducing traffic blockages, improve transit flow and reliability, and improve emergency response to the community. The Proposed Action would also improve delay, congestion, and safety along the I-5 Corridor by reducing spillover traffic from the ramps.

3.9.3.2 Construction Impacts

Under the Proposed Action, construction of corridor improvements would cause traffic delays and some congestion for people moving through the area. Construction is expected to last 2.5 years. During that time, ongoing disruptions could include lane reductions, temporary signals, and bus stop relocations on 4th and 88th streets. In addition, there could be shorter-term (e.g., days or weeks) closures and detours. Throughout construction, the construction contractor would be required to maintain business and pedestrian access. Construction timing and sequencing would be subject to additional provisions intended to keep vehicular traffic, pedestrians, and buses moving as determined by the Tribes, the Washington State Department of Transportation, Snohomish County, and the City of Marysville.

3.9.4 Mitigation

No mitigation is proposed for operational impacts. However, construction impacts related to traffic delays and congestion would be mitigated through the submittal and approval of Traffic Control Plans.

3.10 Noise

The Proposed Action is a transportation improvement project. Although the project does not currently require the approval of or benefit from funding through the Federal Highway Administration (FHWA), the potential for traffic noise to be altered is evaluated below using the guidance of the FHWA and WSDOT.

3.10.1 Data Collection and Analysis

The presence and proximity of noise sensitive receptors was evaluated based on aerial imagery, land use mapping, and windshield survey. Noise sensitive receptors include but are not limited to parks, trails, homes, churches, hospitals, swimming pools, hotels, daycare, and schools.

WSDOT procedures were applied to determine the need for noise analysis (WSDOT 2020).

3.10.2 Existing Conditions

Noise in the project vicinity is dominated by traffic noise from I-5 and the transportation network along the 4th Street and 88th Street NE corridors. The immediate study area is primarily characterized by commercial land uses. The nearest sensitive receptors are southwest of the Coho Creek crossing. The sensitive receptors include two residential dwellings that abut 88th Street NE with building footprints within 100 feet of the paved shoulder

3.10.3 Environmental Consequences

3.10.3.1 Operational

The No Action alternative would not change traffic patterns or traffic noise in the project vicinity.

The Proposed Action would replace existing signalized intersections at seven locations with roundabouts. The first step in the noise analysis process is to determine whether the project includes a Type 1 activity (WSDOT 2020). Type 1 projects have the potential to increase traffic noise levels and/or create traffic noise impacts for noise sensitive receivers, including homes, apartments, and other land uses with noise sensitive areas of frequent outdoor human use. Upon review, the Proposed Action would not include the following Type 1 activities:

- Development of new roads
- Substantial changes to vertical or horizontal alignment of existing roads
- Increasing through-lanes for the existing roads

Additionally, the Proposed Action would not be a Type 2 noise-abatement retrofit project. For the purpose of this noise evaluation, the Proposed Action would essentially be a Type 3 noise abatement that does not typically require a noise analysis. As described in the Affected Environment, it is also important to note that few sensitive receptors have been identified in the project vicinity.

3.10.3.2 Construction

Under the No Action alternative, there wouldn't be any short-term construction-related noise.

Under the Proposed Action, businesses and those few residences near the project area would experience construction noise due to grading, excavating, pavement grinding and cutting, and drilling shafts for the bridge over Coho Creek.

3.10.4 Mitigation

No mitigation is proposed.

3.11 Hazardous Materials

3.11.1 Data Collection and Analysis

This section summarizes the findings of a Hazardous Materials Discipline Report that was prepared in accordance with the WSDOT Environmental Procedures Manual, the American Society for Testing and Materials (ASTM) guidelines (2021), and the WSDOT Guidance and Standard Methodology for Hazardous Materials Discipline Reports (WSDOT 2017). The Hazardous Materials Discipline Report is included in Appendix F (Parametrix 2022e).

3.11.2 Existing Conditions

During regulatory database review (EDR 2022a), 16 sites were identified as having confirmed, or potential for release of a hazardous materials, or petroleum hydrocarbons within 0.25 mile of the project area. Upon review, 13 of the 16 sites were determined to be low risk based on location, regulatory status, or the nature/extent of release. The three remaining sites described below were determined to be medium risk:

- Arco 4390 – 1124 4th Street. This site is confirmed to have leaked gasoline, diesel, and associated compounds into soil and groundwater from leaking underground storage tanks (LUSTs). Recent groundwater monitoring data indicates that groundwater in the area is contaminated below cleanup levels, although the monitoring information is limited and contains gaps. Although a full cleanup of the site has not yet been completed, the contamination has been determined to be outside of the project area.
- Chevron 99609 – 1206 4th Street. This site is confirmed to have leaked gasoline, diesel, and associated compounds into soil and groundwater from an underground storage tank and associated piping. Although the site is currently being cleaned up, residual concentrations of contaminants may remain. Data from the most recent investigation indicates that contamination in groundwater exceeds cleanup levels at the north end of the site adjacent to the project area.
- Marine Drive 76 – 3323 Marine Drive NE. This site may also have contamination from a LUST. Although cleanups were completed, there is limited information for the site regarding any residual concentrations.

Review of historic aerial photographs of the project area does not indicate previous sites of environmental concern in the area, or evidence of adverse conditions due to previous land use in the area (EDR 2022b).

3.11.3 Environmental Consequences

Under the No Action alternative, no hazardous material impacts would occur.

Under the Proposed Action, there would be a potential to encounter residual, low-level petroleum contaminated soil in the vicinity of the three sites listed above. If these areas require deeper excavation, there would be a low to moderate potential of encountering vapors associated with residual gasoline-contaminated groundwater. There would be few impacts on the overall environment in the event of encountering contaminated soil or groundwater.

Due to the developed nature of the project area, there would be some potential for encountering unanticipated contamination in the subsurface soil during project construction. This could have unanticipated consequences; however, the risk would be addressed through project mitigation and BMPs.

3.11.4 Mitigation

In the No Action alternative, there would be no mitigation.

Under the Proposed Action and in conjunction with the property acquisition process, the Tulalip Tribes would perform a level of due diligence investigation commensurate with the risk each property presents. Based on the results of the due diligence process, further plans for mitigation, handling, and disposing of contaminated materials would be developed. A project-wide contaminated media management plan (CMMP) should also be developed and implemented to cover the majority of minor encounters with

contaminated materials. Proposed mitigation would result in contaminant treatment that would be equal or better than the No Action alternative.

For hazardous materials generated during construction, BMPs would be implemented, including but not limited to the following:

- Fueling, maintenance, and cleaning in contained areas
- Minimization of the production or generation of hazardous materials
- Appropriate labeling and storage of hazardous waste per federal regulations
- Designated hazardous waste storage away from storm drains or surface water
- Recycling of materials (used oil- and water-based paint) as appropriate
- Handling any potential spills of hazardous materials in conformance with applicable Material Safety Data Sheets.

3.12 Cumulative Impacts

Per CEQ regulations, a cumulative impact is defined as "the impact on the environment which results from the incremental impacts of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency (federal or non-federal) or person undertakes such other actions." Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time (40 CFR Part 1508.7). The cumulative impact analysis area varies by resource and is discussed below.

3.12.1 Past, Present, and Reasonably Foreseeable Actions

Past, present, and reasonably foreseeable actions must be considered when determining whether there are potential cumulative impacts. Past actions are actions that occurred in the past that may warrant consideration in determining whether there are potential cumulative impacts. Present actions are actions that are occurring in the same general period as the alternatives. Reasonably foreseeable actions are actions that may affect the projected impacts of the alternatives.

Past actions in the project vicinity include construction of the I-5 corridor and development that has occurred along the corridor, including tribal actions such as Quil Ceda Village and the 116th Street interchange project. These actions have contributed to transportation of people and goods through the area and to the economic vitality of the region. While the riparian corridors associated with Coho Creek and Quilceda Creek remain undeveloped and forested, adjoining areas have seen relatively intense development. Development of the transportation system also resulted in full or partial fish passage blockages, such as the barrier currently present on Coho Creek.

Present actions in the project vicinity include a number of transportation improvements such as WSDOT's I-5 – NB Marine View Drive to SR 529 – Corridor and Interchange Improvements, which connects to the Tulalip Tribes' Corridor Improvements project at the 4th Street interchange. The construction of the WSDOT project would overlap the Tribes' project. The Tulalip Tribes are also proceeding with the phased development of its 2,000-acre Quil Ceda Village business park. Two hundred acres have already been developed with an additional phase underway.

Future actions in the project vicinity include the future development projects listed below (Parametrix 2022a):

- 4th Street/Q Casino Corridor improvements
- Marysville Civil Center
- Hotel America Marysville
- Marysville 36th Avenue NE Retail

Between 2019 and 2045, traffic volumes in the area are expected to increase 10 to 230 percent (Parametrix 2022b). The range in growth is due the pipeline projects listed above as well as anticipated development on the reservation located in different sections of the study area.

3.12.2 Impacts of Past, Present, and Reasonably Foreseeable Future Actions

Under the No Action alternative, congestion along 4th Street and 88th Street would continue. The cumulative effect of the No Action with other planned development is that traffic conditions would worsen. This would affect the Tulalip Tribes, the City of Marysville, the greater Snohomish County area, interstate travel and commerce, and even international trade with Canada.

Under the Proposed Action, the Tulalip Tribes have taken steps to reduce the potential for cumulative impacts to the transportation system. In February 2020, the Tulalip Tribes convened a Study Support Team (SST) comprised of representatives from the Tribes, WSDOT, FHWA, City of Marysville, Snohomish County, and Community Transit. Among other objectives, the monthly SST meetings provided a venue for coordinating current and future action as the purpose and need for this project were developed and alternatives were developed and evaluated. As described in the Non-Access Feasibility Study for the project, the Proposed Action is consistent with the land use and transportation plans of the Tribes, Snohomish County, and the City as well as with Puget Sound Regional Council regional plans, including the transit long-range plans. This coordination helps ensure that the cumulative effects of past, present, and reasonably foreseeable future actions result in a functioning transportation system that supports existing land use and planned growth.

The Proposed Action eliminates the fish passage barrier on Coho Creek and restores habitat along the stream in the project vicinity. The Proposed Action would enable most of the stormwater to be infiltrated, improving the water quality of stormwater runoff and when, taken collectively with ongoing regulatory changes and tribal interest in restoring the headwaters of Coho Creek, could improve riparian and aquatic habitat in the project vicinity.

4. PREPARERS AND AGENCY COORDINATION

4.1 Introduction

The CEQ and Department of Interior regulations encourage agencies to involve the public in preparing and implementing NEPA procedures (40 CFR 1506.60), but the extent of public involvement in preparing an EA is at the discretion of the decision-maker (43 CFR 46.305[a]). The public includes federal agencies, state agencies, local agencies, landowners, and other interested parties. Summaries of the public involvement and agency coordination completed during the development of the EA are included below. In addition, the preparers of the EA are also noted.

4.2 List of Preparers

Jenny Baily, Environmental Lead

Parametrix

Katheryn Seckel, Environmental Planner

Parametrix

Savannah Moore, Environmental Planner

Parametrix

4.3 Agency Coordination

Agency representatives who provided technical input on and/or performed reviews of the EA are listed in Table 4-1.

Table 4-1. Individuals Who Provided Technical Assistance and/or Review of the EA

Name	Title	Affiliation
Kurt Nelson	Natural Resources	Tulalip Tribes
Richard Young	Cultural Resources	Tulalip Tribes
Gene Enick	Cultural Resources	Tulalip Tribes
Julia Gold	Planning	Tulalip Tribes
John Maas	Environmental Coordinator	WSDOT
Jim Laughlin	Noise	WSDOT
Anne M. Conrad	Hazardous Materials	WSDOT

5. PUBLIC INVOLVEMENT

A Public Involvement and Communication Plan was prepared and coordinated with input from the Tribes and project stakeholders—WSDOT, the City of Marysville, Snohomish County, and Community Transit—in May 2021.

- The Project webpage was established on the Tulalip Tribes' website in February 2021. Content for the webpage was developed by Parametrix, with review and coordination from the Tribes and WSDOT. The initial webpage provided an overview of the project, current activities, and alternatives in consideration.
- An online open house was set up on the Project webpage and open to comments from the public from January 18, 2022, through February 15, 2022. The online open house provided a status of the project, and the selected alternatives and gave the public an opportunity to comment.
- A second online open house will be conducted after the NEPA environmental assessment is issued to allow the public to comment on the environmental impacts and mitigation.

CITATION

Parametrix. 2024. I-5/4th Street and 88th Street NE
Corridor Improvements Project
Ecosystems Discipline Report,
2024 Update.
Prepared by Parametrix, Seattle, Washington.
August 2024.

TABLE OF CONTENTS

1. INTRODUCTION 1-1
1.1 Project Location 1-1
1.2 Project Purpose 1-1
1.3 Project Design 1-2
1.4 Data Gathered 1-3
1.5 Related Regulations, Plans, and Policies 1-4
1.6 Study Areas 1-5
1.7 Impact Assessment Assumptions 1-5

2. STUDY OBJECTIVES AND METHODS 2-1
2.1 Aquatic Resources 2-1
2.1.1 Study Objectives 2-1
2.1.2 Methods 2-1
2.2 Vegetation and Wildlife Resources 2-2
2.2.1 Study Objectives 2-2
2.2.2 Methods 2-2
2.3 Wetland Resources 2-5
2.3.1 Wetland Resources Study Objectives 2-5
2.3.2 Wetland Resources Methods 2-5
2.3.3 Wetland Determination 2-6

3. AFFECTED ENVIRONMENT 3-1
3.1 Aquatic Resources 3-1
3.1.1 Streams and Stream Habitat 3-1
3.1.2 Fish and Other Aquatic Species 3-3
3.2 Vegetation and Wildlife Resources 3-1
3.2.1 Vegetation 3-1
3.2.2 Terrestrial Wildlife 3-2
3.3 Wetland Resources 3-7
3.3.1 Wetland Descriptions 3-7

4. ENVIRONMENTAL CONSEQUENCES 4-1
4.1 Aquatic Resources 4-1
4.1.1 Effects of the No Action Alternative 4-1
4.1.2 Effects of the Proposed Action 4-1
4.2 Vegetation and Wildlife Resources 4-5
4.2.1 Effects of No Action Alternative 4-5
4.2.2 Effects of the Proposed Action 4-5

TABLE OF CONTENTS (CONTINUED)

4.3 Wetland Resources 4-1
4.3.1 Effects of the No Action Alternative 4-1
4.3.2 Effects of the Proposed Action 4-2

5. POTENTIAL MITIGATION MEASURES 5-1

6. LITERATURE CITED 6-1

1. INTRODUCTION

The Tulalip Tribes (Tribes), in partnership with the Washington State Department of Transportation (WSDOT), Snohomish County, and the City of Marysville, propose to develop and implement access improvements in the vicinity of two interchanges on the Interstate 5 (I-5) corridor within the boundary of the Tulalip Reservation in Snohomish County, Washington. The two interchanges (hereafter referred to as "the project") are at 4th Street (also known as State Route 528 and Marine Drive) and 88th Street NE. The federal nexus for this project is approval by the Bureau of Indian Affairs (BIA) for expansion of existing road right-of-way on tribal lands.

The project also includes a fish passage enhancement element. The project would remove an existing fish barrier at the culvert crossing of Coho Creek under 88th Street and replace it with a 100-foot-long, single-span bridge. As determined through preliminary hydraulic design, the new bridge would have a minimum hydraulic opening of 30 feet and a vertical clearance exceeding the desired wildlife clearance height of 8 feet (Parametrix 2022a).

Consistent with the requirements of the National Environmental Policy Act (NEPA) and the State Environmental Policy Act (SEPA), this report provides information about existing conditions and evaluates the effects of the I-5/4th Street and 88th Street NE Corridor Improvements project on aquatic resources, vegetation and wildlife resources, and wetland resources. In addition, this report presents mitigation options for avoiding, minimizing, and compensating for potential impacts.

1.1 Project Location

The project involves improvements at the I-5 interchanges along 4th Street (exit 199) and 88th Street NE (exit 200). The project area straddles the boundary between Tulalip Tribal land and Marysville in Snohomish County, Washington (see Figure 1 in Appendix A). The project area comprises the extent of ground disturbance for each interchange. The approximate latitude/longitude coordinates of the northern and southern project area limits are 48.077° N/122.1848° W and 48.0480° N/122.1839° W, respectively. The project area is within Water Resource Inventory Area (WRIA) 7 (Snohomish) and hydrologic unit codes (HUCs) 171100110204 (Quilceda Creek) and 171100110203 (Frontal Possession Sound).

The unique study areas for the aquatic resources, vegetation and wildlife resources, and wetland resources described in this report are defined in Section 1.6.

1.2 Project Purpose

The Reservation of the Tulalip Tribes is accessed via three interchanges off I-5 along the eastern boundary of the Reservation. These interchanges are critically important to the Tribes for access to and from the Reservation. The only other access to the Reservation is via a single county road (140th Street NE) at the northern boundary of the Reservation or via the waters of the Puget Sound and Snohomish River.

Improvements to the 116th Street NE interchange were completed in 2020. These improvements were entirely led and funded by the Tribes. Now the Tribes are planning to develop and implement access improvements to the remaining two interchanges on their Reservation. These two interchanges are at 4th Street and 88th Street NE. They experience congestion and cause mobility challenges for cars, trucks, pedestrians, and transit users. Frequently, traffic exiting I-5 to enter the Reservation or Marysville backs up onto the off-ramps and even onto traffic lanes on the I-5 mainline. This impacts the

Tribes and the City as well as the greater Snohomish County area by impeding connections between the Tribes and the City for commuters, residents, visitors, freight, transit, and nonmotorized traffic. Backups cause lengthy delays at the signals crossing I-5 between these two communities, adversely affecting both commerce and emergency services.

The purpose of the I-5/4th Street and 88th Street Corridor Improvements project is to support community and economic vitality by reducing congestion and improving mobility for cars, trucks, emergency services, pedestrians, and transit users traveling to, from, and across I-5 on 4th Street and 88th Street NE and within the Tribes' Reservation while enhancing safety and protecting the integrity of the interstate system and enhancing fish habitat and passage.

1.3 Project Design

The project would include corridor improvements along 4th Street and 88th Street NE as well as fish passage enhancements and stream habitat improvements at the 88th Street NE crossing of Coho Creek (see Figure 1 in Appendix A). Major items of work would include paving, grading, retaining walls, stormwater conveyance and treatment, sidewalks, lighting, utilities, turbid water management, temporary erosion control, clearing and grubbing, vegetation removal, vegetation management (e.g., planting native species in place of non-native species, pavement marking, traffic control, and signing).

Corridor improvements along 4th Street, from west to east, would include the following:

- Replacement of the signaled intersection of 4th Street and 33rd Avenue NE with a new roundabout
- Replacement of the signaled intersection of 4th Street and the southbound I-5 on-/off-ramps with a new roundabout
- Replacement of the signaled intersection of 4th Street and the northbound I-5 on-/off-ramps with a new roundabout
- Channelization improvements entering and exiting the roundabouts
- Reconfigured pedestrian and bicycle access along the alignment

Corridor improvements along 88th Street NE, from west to east, would include the following:

- Replacement of the signaled intersection of 88th Street and 34th Avenue NE (Quil Ceda Blvd) with a new roundabout
- Replacement of the signaled intersection of 88th Street NE and the southbound I-5 on-/off-ramps with a new roundabout
- Replacement of the signaled intersection of 88th Street NE and the northbound I-5 on-/off-ramps with a new roundabout
- Replacement of the signaled intersection of 88th Street and 36th Avenue NE with a new roundabout
- Channelization improvements entering and exiting the roundabouts
- Reconfigured pedestrian and bicycle access along the alignment

The project includes stormwater treatment facilities designed to accommodate runoff from impervious surfaces that are added, replaced, or modified for project construction. The stormwater design employs underground treatment vaults to remove contaminants before runoff from project-related impervious surfaces enters surface waters or aboveground stormwater facilities (e.g., bioswales, infiltration ponds). In addition, the project would decrease the total area of pollution-generating impervious surfaces (PGIS) in the project area by approximately 1 acre and would increase the amount of runoff being treated and/or infiltrated by more than 8 acres.

The fish passage and enhancement work on Coho Creek at the 88th Street NE crossing would replace the undersized 54-inch-diameter concrete culvert and associated gabion-supported road fill prism with a 100-foot, single-span bridge. The new bridge would have a minimum hydraulic opening of 30 feet and a vertical clearance exceeding the desired wildlife clearance height of 8 feet (Parametrix 2022a).

Bridge construction would occur in two stages. First, road fill west of the existing culvert would be excavated sufficiently to construct piers and place girders for the bridge span. The bridge structure would be supported on deep-drilled shafts or soldier pile walls, but wall types and sizes have not yet been determined. No impact or vibratory pile driving is anticipated. Once the bridge structure has been built, Coho Creek would be diverted into a new channel under the bridge. Flow would be introduced to the new channel gradually, to minimize sediment delivery to downstream reaches. The remainder of the road fill would then be excavated, and the existing culvert would be removed. Utilities that are currently buried in the roadway would be attached to the underside of the new bridge.

The proposed stream alignment would move Coho Creek approximately 30 feet west of the existing culvert. Flows would be maintained in the existing channel and culvert while the new channel is being built. Under current conditions, as a result of backwater effects caused by the undersized culvert, the stream has a 90-degree turn and a scour hole upstream of the road crossing. Approximately 90 linear feet of stream channel upstream of the new bridge would be realigned to provide a smooth bend at the road crossing. The new channel would tie back into the existing stream approximately 75 feet downstream of the new bridge to maintain the existing braided channel system. The new channel would match the hydraulic characteristics in the unaffected portions of the stream. Streambed substrates in the new channel would meet WSDOT standards for materials and size. More than 60 pieces of large woody material (including 20 key pieces) would be placed in the stream.

Project construction is expected to require 2 years, with an anticipated start date of June 2025. All construction activities below the ordinary high water line (OHWL) of streams would occur during the in-water work window established by the Tribes (July 15 through September 30).

1.4 Data Gathered

Resource analysts performed literature and data reviews to identify and characterize potentially affected ecosystem resources in and near the project areas. Existing information was compiled and reviewed first so as to focus field survey efforts for verifying data and filling information gaps. Maps and other existing documents were an important resource for identifying ecosystem features in the project study area. The following resources were reviewed:

- Aerial photography of the project corridor (including the Snohomish County aerial photography [Snohomish County 2022] database and Google Earth database [Google Earth 2022])
- Information from websites and agency interviews about sensitive and protected species and habitat from the Washington Department of Fish and Wildlife (WDFW) and the Tulalip Tribes

- Tulalip Tribes Smolt Trap data (TTED 2012)
- Tulalip Tribes Wetland and Stream GIS data (TTED 2021)
- City of Marysville critical area mapping (2019)
- Endangered Species Act (ESA) listing information from the U.S. Fish and Wildlife Service (USFWS 2023) and the National Marine Fisheries Service (NMFS 2023)
- Snohomish County Area Washington Soil Survey (NRCS, USDA 2021a)
- National Wetlands Inventory data (USFWS 2021)
- Priority Habitats and Species (PHS) data (WDFW 2022)
- Statewide Washington Integrated Fish Distribution mapper (NWIFC 2022)
- Fish passage barrier maps from WDFW (WDFW 2021 and WSDOT 2021b)
- USFWS Critical Habitat Maps for Threatened and Endangered Species (USFWS 2022)
- Water Quality Assessment and Clean Water Act Section 303(d) list prepared by the Washington State Department of Ecology (Ecology 2021)
- Washington State Department of Natural Resources (WDNR) Natural Heritage Program database (WDNR 2022)
- Studies of fish and wildlife use of habitats in the project area (e.g., Haring 2002; Pearl 2004; Goetz et al. 2021; Pentec 1992; and others)

1.5 Related Regulations, Plans, and Policies

Project activities that may affect wetlands, aquatic species, and habitat; vegetation, wildlife species, and habitat; or threatened and endangered species in the project areas are subject to the following regulations, plans, and policies:

1.6 Study Areas

The project footprint consists of the construction limits (i.e., the maximum extents within which clearing, grading, and the operation of construction machinery would occur) for the 4th Street and 88th Street NE interchange improvement areas.

The study area for vegetation and wildlife habitat consists of the project footprint plus the areas within 200 feet of either side of the project footprint. For wildlife, the study area includes areas where project construction could affect habitat quality for wildlife species that may use habitats in the area. Habitat evaluations include the vegetation assessment data. Resource analysts also reviewed documented occurrences of sensitive wildlife species within 0.25 mile of the project footprint to study wildlife potentially affected by project-related airborne noise and human activity. The aquatic resources study area includes all waters within the project footprint and all waters that would receive project-related stormwater runoff.

Wetland and stream field studies were conducted up to 300 feet upstream and downstream from where the project footprint cross Coho Creek (in accordance with WAC 173-201A).

1.7 Impact Assessment Assumptions

The impact analysis describes the extent, magnitude, duration, and character of impacts of the two alternatives (No Action and Proposed Action) on ecosystem resources. Impacts are quantified where appropriate and possible (e.g., area of wetland or vegetation impacts).

Under the No Action alternative, fish passage improvements at Coho Creek would not be built. Improvements to in-stream and riparian habitats would not be implemented, and fish and wildlife would not realize the benefits of those improvements. Maintenance to bridges and roadways would continue, but the extent and potential for impacts related to these activities are not defined.

The process of analyzing and estimating project impacts requires a series of assumptions regarding the physical extent of impacts, the duration of impacts, site restoration following construction, and measures that would be implemented to avoid or minimize potential impacts. This includes temporary (construction-related) impacts and permanent (operational) impacts.

For the analysis, the Tribes assumed that all lands within the construction limits would be disturbed during construction and that all vegetation would be removed. The area within the construction limits is referred to as the permanent impact area. A distance of 10 feet extending from the clearing and grubbing line was used to calculate temporary impacts; this area is referred to as the temporary impact area. These assumptions apply to the assessment, restoration, avoidance, and minimization of impacts to vegetation, wildlife habitat, wetlands, and streams.

2. STUDY OBJECTIVES AND METHODS

This document supports the NEPA and SEPA evaluation of impacts associated with the I-5/4th Street and 88th Street NE Corridor Improvements project. Resource analysts reviewed information about the affected environment for aquatic resources, vegetation and wildlife, and wetlands. Information that supported the assessments of the potential project-related impacts on ecosystem components included status of fish and wildlife species, information about habitat conditions for species of concern or their locations, and results of wetland and stream delineation studies. This discipline report identifies and evaluates the potential temporary and permanent impacts of the Proposed Action relative to No Action alternative.

This chapter describes the objectives and methods used to study the aquatic resources (Section 2.1), vegetation and wildlife resources (Section 2.2), and wetland resources (Section 2.3).

2.1 Aquatic Resources

2.1.1 Study Objectives

This section identifies aquatic species known or expected to occur in the study area, characterizes the existing conditions of aquatic habitats, and provides information about species with local, state, or federal regulatory status, including species listed as threatened or endangered under the ESA. The assessment of effects on aquatic species and habitats focuses on key habitats and stream features that may be affected by the project and that are directly related to ecological functions that support stream ecosystems. Resource analysts conducted research and field surveys to identify, map, and describe aquatic species and habitats within the study area. Information about aquatic habitat conditions is based on key aquatic habitat elements, including riparian vegetation, physical in-stream habitat, water quality and quantity, and fish habitat use.

2.1.2 Methods

Resource analysts reviewed background material, including fish distribution data (e.g., NWIFC 2022; WDFW 2022), aerial photographs (Snohomish County 2022; Google Earth 2022), water quality assessments (Ecology 2022), and data and mapping provided by the Tulalip Tribes (TTED 2021, 2021). In the field, biologists conducted aquatic habitat surveys 300 feet downstream and 300 feet upstream of the Coho Creek stream crossing. Biologists collected information about the condition of in-stream and riparian habitats and flagged the OHWL of Coho Creek. Professional land surveyors then surveyed the flagged points.

Streams were classified according to the interim water typing definitions in WAC 222-16-031 and the applicable stream classification systems in the Tulalip Tribal Code and City of Marysville code. Regulatory buffers were assigned based on the stream's classification. Biologists also performed a site evaluation for fish passage at the 88th Street NE culvert conveying Coho Creek.

Analyses of short-term (i.e., construction-related) effects on aquatic resources were based on the amounts of aquatic habitat and regulatory stream buffers within the portions of the project footprint that would be subject to temporary modification. Analyses of long-term effects on vegetation and wildlife resources were based on the amounts of aquatic habitat and regulatory stream buffers within the portions of the project footprint that would be subject to permanent modification. Effects of stormwater inputs into aquatic resources were also analyzed for the impact assessment.

2.2 Vegetation and Wildlife Resources

2.2.1 Study Objectives

Resource analysts reviewed the existing condition and regulatory status of plants and animals that could be affected by construction and operation of the project.

2.2.2 Methods

Based on literature review and field observations, resource analysts identified vegetation types and wildlife habitat features in the study area and evaluated the potential for wildlife species to use those habitats. The wildlife species assessed included ESA-listed species and other species with regulatory status under local CAOs. Resource analysts reviewed data from the WDFW PHS program, data from the WDNR Natural Heritage Program, the USFWS Information for Planning and Consultation website, local critical area maps and Tribal mapping layers, aerial photographs, and more.

Resource analysts delineated and classified cover types (land cover) using aerial photographs and visited these areas during field surveys. Vegetation types were identified within 200 feet of the project footprint. The eleven mapped cover types include:

- Emergent Wetlands
- Scrub-Shrub Wetland
- Stream Channels
- Riparian Forest
- Upland Forest
- Shrublands
- Mown Grass and Landscaping
- Roadside Right-of-Way
- Stormwater Facilities
- Residential
- Developed Unvegetated Surfaces

Habitats are described in Table 2-1 along with a qualitative assessment of relative habitat value. Relative habitat value is based on habitat structure, disturbance types and frequency, and time required to recover habitats following clearing.

Wildlife habitat values were not attributed to each occurrence of a cover type along the project corridor but instead were assigned to the cover type as a whole. Habitat value within a cover type at a specific location can vary and depends on several factors, such as size of the area; presence of (or proximity to) other valuable habitat; level and type of human disturbance; diversity of plant species; presence of multiple cover layers (i.e., tree, shrub, forb, and emergent layers); presence of threatened, endangered, or sensitive species; and extent of invasive weeds.

The City of Marysville defines significant trees as evergreen trees with a diameter of 8 inches, as measured 4 feet above grade, and deciduous trees with a 12-inch diameter (MMC 22A.020.200). The Tulalip Tribal Code does not include definitions for significant trees. Therefore, all trees greater than

8 inches as measured 4 feet above grade were identified as significant trees within the study area. The Tulalip Tribal Code does define "environmentally sensitive lands" to include essential habitat for animals and/or plants considered culturally important to the Tribes (TTC 7.110.020).

Table 2-1. Cover Types and Associated Wildlife Habitat Value for I-5/4th Street and 88th Street NE Corridor Improvements Project

Cover/Habitat Type	Description	Habitat Value in the Study Area
Emergent Wetlands	Wetland areas dominated by rushes, sedges, and grasses.	High. Moderate structural complexity. The riparian wetland functions further elevate the value of this habitat to wildlife and aquatic processes. It would take months to years to recover this habitat following disturbance.
Scrub-Shrub Wetland	Wetland areas dominated by shrub species such as willow and red-osier dogwood.	High. Moderate structural complexity. The riparian wetland functions further elevate the value of this habitat to wildlife and aquatic processes. It would take months to years to recover this habitat following disturbance.
Stream Channels	Relatively non-vegetated stream and river channels. Some submerged aquatic vegetation is present.	High. Many in-stream processes elevate the value of this habitat to terrestrial and aquatic wildlife. It would take months to years to recover this habitat following disturbance.
Riparian Forest	Areas dominated by trees within approximately 200 feet of the OHWL of streams and rivers.	High. Moderate structural complexity. The proximity to streams further elevates the value of this habitat to wildlife and aquatic processes. It would take months to years to recover this habitat following disturbance.
Upland Forest	This habitat type is represented by stands of mature trees in upland areas.	Medium. There is moderate structural complexity and disturbance level is moderate. Longer time to recover this habitat following disturbance. The small patches of forest and their proximity to roads and commercial areas increases disturbance for wildlife and decreases habitat quality. It would take a longer time (years to decades) to recover this habitat following disturbance.
Shrubland	This habitat type includes patches of Himalayan blackberry along with areas of horticultural varieties and native shrubs.	Medium. Areas include native and non-native shrubs. Native shrubs support native wildlife species throughout their life histories. Although invasive species limit habitat diversity, thickets of blackberry and other invasive shrubs provide perching, nesting, and hiding habitat for small birds, reptiles, and mammals, including foraging habitat for some species. The small and/or narrow patches of shrubland and their proximity to roads and commercial areas increases disturbance for wildlife and decreases habitat quality. It would take months to years to recover this habitat following disturbance.

Table 2-1. Cover Types and Associated Wildlife Habitat Value for I-5/4th Street and 88th Street NE Corridor Improvements Project (continued)

Cover/Habitat Type	Description	Habitat Value in the Study Area
Mown Grass and Landscaping	This cover type includes regularly mown grass and sparse horticultural trees and shrubs.	Medium. There is moderate habitat structure and the disturbance is high. These areas may provide some browsing habitat for herbivores, such as deer, rabbits, and rodents, and some limited foraging and nesting habitat for birds. This habitat type would be quick to reestablish (days to weeks) to current conditions after disturbance.
Roadside Right-of-Way	Areas along roadways that are maintained for vehicular safety with mowing and herbicide application. These areas are disturbed regularly with maintenance actions, roadway noise, and pollution. These areas are dominated by non-native grasses and forbs and invasive species.	Low. There is limited habitat structure and the periodic maintenance disturbance is high. These areas may provide some browsing habitat for herbivores such as deer, rabbits, and rodents, and some limited foraging habitat for birds. This habitat type would be quick to reestablish (days to weeks) to current conditions after disturbance.
Stormwater Facilities	Areas excavated specifically to detain and manage stormwater from impervious areas. Most areas are dominated by non-native grass species and are typically maintained through mowing and dredging.	Low. The limited structural diversity and periodic disturbance regime limits the value to wildlife. The ponded habitat tends to have a highly variable water table and polluted water source, severely limiting the value of the habitat to aquatic species. This habitat type would be quick to reestablish (days to weeks) to current conditions after disturbance
Residential	Areas dominated by single family homes and ancillary buildings. Some trees and patches of understory occur.	Medium. Moderate structural complexity with mature trees and understory species. These areas receive a moderate level of disturbance. It would take months to years to recover this habitat following disturbance.
Developed Unvegetated Surfaces	Paved roadways and other impervious and artificial surfaces. Also includes parking lots and artificially surfaced playfields, commercial, and industrial areas.	Low. There is minimal structural complexity. These areas generally lack wildlife habitat features and are a risk to wildlife. Developed unvegetated surfaces may have some habitat value because structures may provide cover, perch, and even nesting opportunities.

Using field observation, aerial photographs, and pertinent literature, project resource analysts gathered and classified vegetation data, including dominant plant species composition and relative abundance by habitat type. Figures were developed showing the delineated vegetation communities and habitat types and other key ecological features needed to analyze impacts of the project. Sensitive information regarding the locations of proposed, candidate, and listed species and habitats are described in this report but not mapped to protect the integrity of this information.

To support the analysis of effects on wildlife, resource analysts identified wildlife species that are associated with the land cover types in the study area and with specific habitat elements within each cover type. Resource analysts identified the relative function of each plant community in providing habitat for wildlife, based on field observations, literature review, professional opinion, and agency consultation. Resource analysts also assessed locations of known ecologically sensitive areas and important wildlife occurrences that may be sensitive to disturbance from noise or human presence. The assessment included

a review of site-specific wildlife data, including bird surveys (e.g., eBird 2022), supplemented with data gathered during field visits.

Analyses of short-term (i.e., construction-related) effects on vegetation and wildlife resources were based on the amounts of different land cover types within the portions of the project footprint that would be subject to temporary modification as well as the potential for construction-related noise and human activity to disturb wildlife species of concern at breeding sites and other sensitive areas. Analyses of long-term effects on vegetation and wildlife resources were based on the amounts of different land cover types within the portions of the project footprint that would be subject to permanent modification.

In June 2022, in accordance with the requirements of Section 7 of the ESA, BIA initiated consultation with USFWS and NMFS concerning the potential effects of the I-5/4th Street and 88th Street NE Corridor Improvements project on ESA-listed species and critical habitat. The biological assessment prepared to support consultation provides additional information on ESA-listed species and designated critical habitat and any potential direct and indirect impacts of the project (Parametrix 2022b).

2.3 Wetland Resources

2.3.1 Wetland Resources Study Objectives

Wetland resources were mapped and characterized to accurately provide the following information:

- An inventory of wetlands, buffers, and their conditions in the study area
- The project's temporary and permanent impacts on wetlands
- Methods to avoid, minimize, or compensate for impacts

2.3.2 Wetland Resources Methods

Wetlands were evaluated using background information and data collected during field surveys. Background information on soils, hydrology, previously mapped wetlands, and aerial photography was used to assess site conditions and strategize field surveys. A field survey was conducted to identify, map, and describe wetlands within the study area.

Vegetation, soil, and hydrology conditions were documented at representative locations (sample plots) using methods outlined in the U.S. Army Corps of Engineers Wetland Delineation Manual (Environmental Laboratory 1987) and indicators described in the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (Version 2.0) (USACE 2010). These sample plots were identified in the field with labeled flagging and documented by professional surveyors. Both wetland and upland sample plots were documented. If a wetland contained multiple vegetation types (e.g., forested and scrub/shrub), at least one wetland sample plot was located in each cover type. Wetland determination data forms were developed for all sample plots. Observations of existing conditions and characteristics were recorded for each wetland and associated buffer.

Wetlands were classified according to the USFWS system (Cowardin et al. 1979; FGDC 2013) and the hydrogeomorphic (Brinson 1993) classification systems. Wetland ratings and functions were assessed by applying the Washington State Wetland Rating System for Western Washington – 2014 Update (Hruby 2014). Wetlands were also classified and rated according to Tulalip Tribal Code and City of Marysville code.

2.3.3 Wetland Determination

Wetland determinations are based on an analysis of background data and the results of site investigations. Wetland delineations occurred on November 19 and 20, 2019, and November 23, 2020.

The Regional Delineation Supplement Version 2.0 (USACE 2010) recommends using methods described in Chapter 19 in Engineering Field Handbook (NRCS, USDA 2021b) to determine if precipitation occurring in the 3 full months prior to the site visit was normal, drier than normal, or wetter than normal. Actual rainfall is compared to the normal range of the 30-year average.

According to the Applied Climate Information System (ACIS) Climate Analysis for Wetlands Tables (WETS Tables) and climate data recorded at the Everett Weather Station, the period prior to the November 2019 field investigation (October, September, August) was normal. The 3-month period prior to the November 2020 field investigation was also normal (ACIS 2021).

3. AFFECTED ENVIRONMENT

The following sections describe the existing conditions of aquatic resources, vegetation, wildlife, and wetlands that may be affected by the construction of the I-5/4th Street and 88th Street NE Corridor Improvements project. Scientific names of species identified in this report are listed in Appendix B.

3.1 Aquatic Resources

This section identifies aquatic species and habitats that may be affected by the construction of the I-5/4th Street and 88th Street NE Corridor Improvements project. The project is located at two interchanges along the I-5 and at one culvert stream crossing under 88th Street NE. The project occurs within Land Resource Region (LRR) A and Major Land Resource Area (MLRA) 2 and spans through two watersheds: Quilceda Creek (HUC 171100110204) and Snohomish River-Frontal Possession Sound (HUC 171100110203), north to south, respectively.

3.1.1 Streams and Stream Habitat

The following section describes streams present within the study area and provides information about the aquatic habitat elements, such as riparian vegetation, physical in-stream habitat, water quality and quantity, fish presence, fish habitat use, and stream typing. Streams that may be affected by project-related stormwater inputs are included within the study area and are therefore included within this section.

Three streams (Coho Creek, Quilceda Creek, and Ebey Slough) were identified within the aquatic resources study area. Coho Creek flows into Quilceda Creek, which drains into the Ebey Slough within the Snohomish River estuary system. Construction of a replacement bridge at 88th Street NE would entail work within Coho Creek. Quilceda Creek and Ebey Slough are included in the study area because they would receive stormwater runoff from impervious surfaces created or replaced by the project. The extent of the aquatic resources study area reflects the area where potential contaminants from stormwater outfalls may be expected to exceed background levels. The volume of water in Ebey Slough will dilute contaminants in stormwater to negligible almost immediately after treated stormwater enters the slough. Therefore, the aquatic resource study area terminates at the confluence of Quilceda Creek and Ebey Slough.

Table 3-1 summarizes these streams. Figure 1 in Appendix A shows the location of these streams. The OHWL for Coho Creek was delineated 300 feet upstream and downstream of the 88th Street NE crossing. These boundaries are shown on Figure 2 in Appendix A.

Table 3-1. Summary of Streams in the Study Area

Stream Name	State Interim Water Type[a]	Local Jurisdiction	Local Jurisdiction Stream Classification[b]	Local Jurisdiction Buffer Width (feet)[c]
Coho Creek	Type 2	Tulalip Tribes	Class I	200
Quilceda Creek	Type 1	Tulalip Tribes	Class I	200
Ebey Slough	Type 1	Tulalip Tribes	Class I	200

[a] WAC 222-16-031
[b] TTC 7.110.060
[c] TTC 7.110.070

3.1.1.1 Coho Creek

The headwaters of Coho Creek are in Quil Ceda Village on the Tulalip Reservation (Quil Ceda Village 2009). Coho Creek runs south for approximately 1 kilometer before converging with Quilceda Creek. Quilceda Creek outlets into Ebey Slough, a tidal estuary that branches from the Snohomish River and flows into the Puget Sound.

In the 88th Street NE project area, the stream has an unconfined, low-gradient channel. Stream flows remain within incised channels (averaging 1 foot in depth) under normal flow conditions but quickly jump the banks into a wide floodplain during periods of higher flow. Emergent and scrub-shrub dominated wetlands occupy the floodplain and riparian habitats. Riparian vegetation is dominated by dense reed canarygrass and common cattail, with lesser amounts of shrubs, including red-osier dogwood, black twinberry, willow, and immature red alder. Coho Creek is considered a class 1 stream, as it is a perennial stream used by salmonids (TTC 7.110.060) and therefore has a buffer of 200 feet (TTC 7.110.070). This buffer is referred to as the riparian buffer within this report and includes the combined stream and wetland buffer.

Large woody material is recruited, in small amounts, where the channel is close to the interphase between wetland and upland habitats. Beaver activity is extensive in the Coho Creek drainage basin. Beaver dams are present both upstream and downstream of the 88th Street NE crossing, but not within 200 feet of the road. In-stream cover is relatively low due to the lack of large woody material. However, dense overhanging vegetation likely provides some measure of cover and refuge.

Substrates in the study area are dominated by fine-grained materials, primarily sand with areas of patchy gravel where conditions allow. Areas of increased erosion and channel incision (exceeding 10 feet) are located approximately 0.2 mile upstream of the crossing, which has contributed to the fine sediment bedload observed in the lower reaches of the stream, including the study area. As the project reach is largely depositional, the buildup of the fine sediments limits the suitability of the project area for spawning. Overall, fine sediment deposition is a limiting factor for all salmonids in the Coho Creek system. Additional factors that limit spawning within the project area include elevated water temperatures and low flows.

Coho Creek is conveyed under 88th Street NE in a 54-inch concrete pipe. It was identified by WDFW and WSDOT as a fish passage barrier (Site ID 102 Q034). WDFW biologists visited the culvert in 1999, but they were unable to evaluate its status as a fish passage barrier (WDFW 1999b). Based on evidence of backwater effects (a 90-degree turn and a scour hole upstream of the road crossing), it is likely that the culvert is undersized and presents a velocity barrier to fish under high-flow conditions.

The Tulalip Tribes have undertaken extensive habitat restoration projects in and along Coho Creek, upstream of 88th Street NE. Projects have included barrier removal (18 culverts removed or replaced), spawning gravel placement, channel reconstruction, riparian planting, and placement of log habitat structures. Before these efforts began in 2001, salmonids were not known or expected to use habitats in Coho Creek. Between 2002 and 2011, Tulalip tribal biologists monitored fish use of the stream and found evidence that coho salmon, chum salmon, and cutthroat trout spawn in Coho Creek (TTED 2012; Nelson 2021, personal communication).

3.1.1.2 Quilceda Creek

Coho Creek joins Quilceda Creek approximately 4,050 feet (0.9 mile) downstream of the 88th Street NE crossing. Quilceda Creek receives stormwater runoff from the 88th Street NE project area. Quilceda Creek is a low-gradient channel within a broad valley known as the Marysville Trough. A high

groundwater table supports stream flows, and the water table fluctuates rapidly in response to precipitation (Quil Ceda Village 2009). Tidal influence in the main stem extends to a point just upstream of I-5. Emergent and scrub-shrub wetlands occupy the floodplain and include vegetation such as reed canarygrass, willow, alder, and red-osier dogwood. Mature trees line the riparian corridor of the stream.

Based on the high proportion of fine substrates, Quilceda Creek is considered "not properly functioning" for substrate conditions (Snohomish County 2002). Potentially suitable spawning gravels are present in some sections of the stream upstream of the study area, however. The mainstem section of Quilceda Creek east of I-5 is listed on the 303(d) list for failure to meet dissolved oxygen standards (Ecology 2021).

3.1.1.3 Ebey Slough

Quilceda Creek flows into Ebey Slough west of the 4th Street project area. Ebey Slough receives stormwater runoff from the 4th Street project area. Ebey Slough is a right-bank slough channel and tidally influenced distributary of the Snohomish River. The slough diverges from the main stem of the Snohomish River approximately 8 miles upstream from the river's mouth. Ebey Slough then flows north-northwest before discharging to Possession Sound approximately 2 miles north of the Snohomish River.

The north (right) bank of Ebey Slough in the study area, in the vicinity of I-5, has been highly modified by historic and current land use practices. Riparian vegetation is limited to a narrow band, only a few feet wide, vegetated mostly with weedy herbaceous species. Bottom substrates in the study area are dominated by fines, primarily sand and silt. Maximum depths at slack tide range from 8 to 12 feet (Laughlin 2011). In contrast, the north bank of Ebey Slough transitions to a large, intact wetland complex, west of the study area. A total maximum daily load allocation has been established for Ebey Slough to address low concentrations of dissolved oxygen downstream of I-5 (Ecology 2021).

3.1.2 Fish and Other Aquatic Species

Fish species, including Chinook salmon, steelhead, bull trout, pink salmon, coho salmon, and chum salmon, use Ebey Slough primarily as a migration corridor and as a physiologic transition zone between marine and freshwater environments. Ebey Slough also provides rearing habitat and serves as a migratory corridor for juvenile salmonids. Quilceda Creek provides a migratory corridor and rearing habitat as well as limited-potential spawning habitat for Chinook salmon, steelhead, and other fish species.

Species of fish known to be present within the 88th Street NE project area along Coho Creek include coho salmon, chum salmon, and resident coastal cutthroat trout (NWIFC 2022; TTED 2012). The Tulalip Tribes operated a smolt trap upstream of the project area between 2002 and 2011 and documented resident coastal cutthroat trout, coho smolts, and coho and chum fry. The Tulalip Tribes also conduct annual spawner surveys in Coho Creek and have documented both coho and chum adults; however, while coho adult returns have remained fairly consistent, no chum adults have been observed over the last 2 years (Nelson 2021, personal communication). Species that have not been documented in the project area but have the potential to occur given suitable stream gradients include Chinook salmon, pink salmon, steelhead, and bull trout (NWIFC 2022).

3.1.2.1 Species of Concern

Species of concern, defined as those with a regulatory status that prompts individual attention through federal, state, and/or local permitting processes, include the following:

- Species listed or proposed for listing as threatened or endangered under the ESA
- Species that have established Fish and Wildlife Habitat Conservation Areas (FWHCAs) under local critical area rules
- Essential habitat for animals considered culturally important to the Tulalip Tribes as listed under TTC 7.110.020
- Species that have established FWHCAs under local critical area rules
  - In the City of Marysville, areas designated as FWHCAs include the following:
    - Areas where any of the following species have a primary association: species listed as state endangered, state threatened, state sensitive, or state candidate, as well as species listed or proposed for listing by USFWS or NMFS
    - State priority habitats and areas associated with state priority species
    - Habitats and species of local importance

Resource analysts reviewed WDFW's lists of state- and federally listed species, as well as the list of state priority species and culturally important species to the Tulalip Tribes and identified aquatic species of concern that may use habitats in the study area.

ESA-Listed Species

Discussions in this document pay particular attention to species with listing status under the ESA because such status triggers additional regulatory review. The ESA requires each federal agency (in this case, the BIA) to ensure that any actions it undertakes or approves do not jeopardize the continued existence of endangered or threatened species or result in the destruction or adverse modification of their designated critical habitat. To meet this requirement, BIA initiated consultation with USFWS and NMFS concerning the potential effects of the I-5/4th Street and 88th Street NE Corridor Improvements project on ESA-listed species and critical habitat. The Tulalip Tribes prepared a biological assessment to serve as the basis for the consultation (Parametrix 2022b).

The biological assessment analyzes the potential for the project to result in adverse effects on ESA-listed species and critical habitat for those species. The biological assessment addresses the following species and critical habitats in aquatic areas:

- Puget Sound Chinook salmon
- Puget Sound steelhead,
- Bull trout
- Southern Resident killer whale
- Designated critical habitat for Puget Sound Chinook salmon
- Designated critical habitat for Puget Sound steelhead
- Designated critical habitat for bull trout

The following subsections summarize the status of these species as well as the timing and nature of their habitat use in the study area.

Puget Sound Chinook Salmon

Chinook salmon in the Puget Sound evolutionarily significant unit (ESU) are listed as threatened under the ESA (64 Federal Register [FR] 14308, March 24, 1999). The ESU includes naturally spawned Chinook salmon originating from rivers flowing into Puget Sound, along with Chinook salmon from 26 artificial propagation programs. Primary factors contributing to declines in Chinook salmon in the Puget Sound ESU include habitat blockages, genetic modification of wild fish through interbreeding with hatchery fish, urbanization, logging, hydropower development, harvests, and flood control and flood effects (NMFS 1998).

The Snohomish River basin supports both summer-run and fall-run Chinook stocks, which enter the system between June and September and then spawn from early fall through late November (NWIFC 2022; WDFW 2021; Haring 2002). Adult summer-run and fall-run Chinook are expected to be in Ebey Slough from June to September, migrating through the estuary on their way to spawning habitat in the Snohomish River system. Juvenile Chinook salmon have been captured in Ebey Slough during all months (Rice et al. 2014). Densities are highest during May and June, corresponding to the peak of the estuary residence time for juvenile Chinook from the Snohomish River system (Rice et al. 2014; Haring 2002). During beach seine surveys conducted in the Snohomish River estuary in 2013, Rice et al. (2014) found juvenile Chinook salmon at densities of 700 to 900 fish per hectare during May and June. Densities fell off rapidly in August (approximately 200 fish per hectare) and September (less than 100 fish per hectare) and began increasing again in March (approximately 160 fish per hectare) and April (approximately 240 fish per hectare).

According to Northwest Indian Fisheries Commission (NWIFC 2022), summer-run Chinook salmon have been documented in Quilceda Creek, and fall-run Chinook spawn in Quilceda Creek. Although the number of Chinook salmon that spawn in Quilceda Creek is low compared to other systems, the population in that stream contributes to genetic diversity at a broader scale (Nelson 2022c, personal communication). Suitable spawning substrates are not widely available in the Quilceda Creek watershed (Quil Ceda Village 2009). Only a few spawning areas have been identified along the main stem of Quilceda Creek, approximately 3 miles upstream from the study area (NWIFC 2022). Juvenile Chinook salmon from the Quilceda Creek system are predominantly ocean-type—that is, they migrate downstream from April to early June and are largely absent from fresh waters by mid-July (Quil Ceda Village 2009).

Neither NWIFC (2022) nor WDFW (2021, 2022) reports the documented or expected presence of Chinook salmon in Coho Creek. The stream is characterized as gradient accessible, meaning no natural barriers preclude access to habitats in the study area. However, low flows, high water temperatures, and a preponderance of fine sediments render the stream unsuitable for spawning (Nelson 2022a, personal communication). It is possible that rearing juveniles may enter Coho Creek, although no Chinook salmon were documented at the smolt trap that was in place between 2002 and 2011 at 27th Ave NE, approximately 0.4 mile upstream of 88th Street NE (TTED 2012). Juvenile and adult Chinook salmon are unlikely to be present in Coho Creek during the in-water work window (Nelson 2022a, personal communication).

Portions of Ebey Slough and Quilceda Creek in the action area established for ESA consultation have been designated as critical habitat for Puget Sound Chinook salmon (70 FR 52629, September 2, 2005). Coho Creek was not included in the designation (Parametrix 2022b).

Puget Sound Steelhead

The Puget Sound steelhead distinct population segment (DPS) is listed as a threatened species (72 FR 26722, May 11, 2007). The DPS includes all naturally spawned anadromous steelhead originating below natural and manmade impassable barriers from rivers flowing into Puget Sound (79 FR 20802, April 14, 2014). The DPS also includes steelhead from six artificial propagation programs.

As described above for Chinook salmon, the wildlife study area includes portions of three streams where steelhead may be present. The presence of steelhead in these streams is described below.

The Snohomish River basin supports both summer-run and winter-run steelhead (NWIFC 2022; WDFW 2021). Summer-run steelhead pass through the lower estuary, including Ebey Slough, and return to freshwater systems between May and October (Haring 2002). Winter-run steelhead pass through the lower estuary and return to freshwater systems between November and April. For both runs, spawning takes place in freshwater habitats from January through June (Haring 2002). Steelhead smolts, because of their larger size and age compared to other species of outmigrating juvenile salmonids, typically do not linger in the estuarine environment before moving into the marine environment. Limited numbers of steelhead smolts have been sampled in estuary marshes, including Ebey Slough, primarily from mid-April though early July, although some steelhead smolts have been sampled through August (Pentec 1992).

According to NWIFC (2022), summer-run steelhead have been documented in Quilceda Creek, and juvenile winter-run steelhead rear in Quilceda Creek. Summer-run steelhead are typically found only where habitat is not fully utilized by winter-run populations; therefore, it is unlikely that many summer-run steelhead are present in Quilceda Creek (Quil Ceda Village 2009). Spawning activity within Quilceda Creek is limited to small areas with suitable substrate. Based on the preponderance of fine sediments, reaches of Quilceda Creek in the study area are extremely unlikely to support steelhead spawning (Nelson 2022b, personal communication). Based on the freshwater residence time of juvenile steelhead (typically 2 to 3 years), rearing juveniles that originate from spawning grounds farther upstream in the system may be present in the study area at any time of year.

Neither NWIFC (2022) nor WDFW (2021, 2022) reports the documented or expected presence of steelhead in Coho Creek. The stream is characterized as gradient accessible, meaning no natural barriers preclude access to habitats in the study area. However, low flows, high water temperatures, and a preponderance of fine sediments render the stream unsuitable for spawning (Nelson 2022a, personal communication). It is possible that rearing juveniles may enter Coho Creek, although no steelhead were documented at the smolt trap that was in place between 2002 and 2011 at 27th Ave NE, approximately 0.4 mile upstream of 88th Street NE (TTED 2012). Juvenile and adult steelhead are unlikely to be present in Coho Creek during the in-water work window (Nelson 2022a, personal communication).

Portions of Ebey Slough and Quilceda Creek in the action area that was established for ESA consultation have been designated as critical habitat for Puget Sound steelhead (81 FR 9251, February 24, 2016). Coho Creek was not included in the designation (Parametrix 2022b).

Bull Trout

USFWS listed bull trout as threatened under the ESA on November 1, 1999 (64 FR 58910). USFWS proposed Dolly Varden for listing as endangered on January 9, 2001 (66 FR 1628) due to similarity of appearance with bull trout and because they overlap with bull trout in the coastal and Puget Sound region. A designation of threatened or endangered under the similarity of appearance provisions of the ESA extends the take prohibitions of Section 9 to cover the species. However, under section 4(e) of the ESA, a designation of threatened or endangered due to similarity of appearance does not extend other protections of the ESA, such as the consultation requirements for federal agencies under Section 7.

Although not formally discussed in this document, the effects of the action on Dolly Varden are anticipated to be similar to those discussed for bull trout.

As described above for Chinook salmon, the wildlife study area includes portions of three streams where bull trout may be present. The presence of bull trout in these streams is described below.

The Snohomish River supports one of eight core populations of bull trout in the Puget Sound Management Unit (USFWS 2004). Fluvial and anadromous bull trout adults, subadults, and juveniles use habitats in estuarine habitats near the river's mouth, including Ebey Slough, primarily during spring and summer. Goetz et al. (2021) found the residence time of bull trout in marine waters to be fairly brief; most bull trout adults and subadults entered marine waters from April to June and migrated back into rivers by July and August as temperatures rose. Bull trout were not detected in the Snohomish River delta from October through December (Goetz et al. 2021) Spawning adults head upstream to headwater tributaries; anadromous subadults overwinter in the mainstem Snohomish River, generally upstream of the head of Ebey Slough, outside the study area (USFWS 2004; Goetz 2016; Pentec 2002; Snohomish Basin Salmon Recovery Forum 2005). Juvenile bull trout move through the estuary as they migrate out of the Snohomish River system during spring and summer (primarily mid-April through mid-July) (Goetz et al. 2004).

According to NWIFC (2022), bull trout may rear in the main stem of Quilceda Creek. On the other hand, USFWS found no clear documentation of bull trout use in this system, although they acknowledged the possibility that bull trout may enter the stream on occasion to forage (70 FR 56211, September 26, 2005). Based on the stream's distance from known spawning areas, elevated water temperatures in the stream, and the lack of suitable substrates, bull trout are not expected to spawn in the Quilceda Creek system. WDFW (1999a) determined that successful spawning by bull trout occurs only upstream of the winter snow line (i.e., the elevation at which snow is present on the ground for much of the winter); no portions of the Quilceda Creek watershed are upstream of this line. If any bull trout are present in Quilceda Creek, they would likely be rearing juveniles or overwintering adults or subadults (Quil Ceda Village 2009; Marks 2021, personal communication).

Neither NWIFC (2022) nor WDFW (2021, 2022) reports the documented or expected presence of bull trout in Coho Creek. The stream is characterized as gradient-accessible, meaning no natural barriers preclude access to habitats in the study area. However, low flows, high water temperatures, and a preponderance of fine sediments render the stream unsuitable for spawning (Nelson 2022a, personal communication). In addition, as noted above, bull trout are not expected to spawn in the Quilceda Creek system. It is possible that adults or subadults may enter Coho Creek to forage, although no bull trout were documented at the smolt trap located on 27th Ave NE (TTED 2012). Bull trout are unlikely to be present in Coho Creek during the in-water work window (Nelson 2022a, personal communication).

Portions of Ebey Slough in the action area that was established for ESA consultation have been designated as critical habitat for bull trout (Parametrix 2022b).

Southern Resident Killer Whale

The Southern Resident DPS of killer whales was listed as endangered on February 16, 2006 (70 FR 69903), and a recovery plan was completed in 2008. In 2016, NMFS completed a 5-year review and concluded that Southern Resident killer whales should remain listed as endangered.

The recovery plan identified several factors that may be limiting the recovery of Southern Resident killer whales. These include quantity and quality of prey, toxic chemicals that accumulate in top predators, and disturbance from sound and vessels (NMFS 2008). Oil spills are also a risk factor. It is likely that multiple threats are acting together to impact the whales. Although it is not clear which threat or threats are most

significant to the survival and recovery of the species, all the threats identified are potential limiting factors in the population dynamics of the DPS (NMFS 2008).

Chinook salmon make up a significant proportion of Southern Resident killer whale diets. Estimates range from approximately 70 percent during winter and spring to more than 90 percent during summer and fall (NMFS 2021).

Southern Resident killer whales use marine and estuarine habitats. The study area for aquatic resources includes a very small area of marine/estuarine habitat in Ebey Slough. This habitat consists of shallow, confined areas that Southern Resident killer whales are not expected to enter. There have been no documented observations of Southern Resident killer whales in the study area. The study area does not include any areas that have been designated as critical habitat for Southern Resident killer whales. However, based on the project's potential to affect a primary prey source (Chinook salmon), Southern Resident killer whales are addressed in the biological assessment for this project (Parametrix 2022b).

Essential Fish Habitat

The Magnuson-Stevens Fishery Conservation and Management Act, as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267), requires federal agencies to consult with NMFS on activities that may adversely affect designated essential fish habitat (EFH) for federally managed commercial fisheries. The biological assessment that was prepared to support ESA consultation also addresses potential impacts on EFH. The action area established for EFH consultation includes waters designated as EFH for Pacific salmon (Chinook, coho, and pink), Pacific coast groundfish, and coastal pelagic species.

Other Aquatic Species of Concern

In addition to the ESA-listed species discussed above, several species that may use aquatic habitats in the study area have state listing status or are considered culturally important to the Tulalip Tribes. Species that may use habitats in the study area are identified in Table 3-2 along with each species' regulatory status and a description of habitat use in the study area.

Table 3-2. ESA and State-Listed Aquatic Species That May Use Habitats in the Study Area

Species	Status	Habitat Use in Study Area
Fish		
Puget Sound Chinook salmon	TCS, FT	Adult summer-run and fall-run Chinook are expected to be in Ebey Slough. Juvenile Chinook salmon have been captured in Ebey Slough during all months. Chinook use of Quilceda Creek is characterized as "relatively minimal." Coho Creek is gradient accessible to Chinook, and it is possible (although unlikely) that rearing juveniles may enter Coho Creek. No Chinook salmon were documented at the Tulalip Tribes smolt trap on Coho Creek.
Puget Sound steelhead	TCS, FT	Summer-run and winter-run steelhead are present in Ebey Slough. Quil Ceda Creek is unlikely to support spawning, but rearing juveniles may be present. Coho Creek is gradient accessible to steelhead, and it is possible (although unlikely) that rearing juveniles may enter Coho Creek. No steelhead were documented at the Tulalip Tribes smolt trap on Coho Creek.
Bull trout	TCS, FT	Bull trout are present in Ebey Slough primarily during spring and summer. If any bull trout are present in Quilceda Creek, they would likely be rearing juveniles or overwintering adults or subadults. Coho Creek is gradient accessible to bull trout, and it is possible (although unlikely) that adults or subadults may enter Coho Creek to forage. No bull trout were documented at the Tulalip Tribes smolt trap on Coho Creek.
Chum salmon	TCS, SP	Spawning in Coho Creek, November to December; fry emerge from redds around March and migrate directly to marine waters without rearing.

Table 3-2. ESA and State-Listed Aquatic Species That May Use Habitats in the Study Area (continued)

Species	Status	Habitat Use in Study Area
Coho salmon	TCS, SP	Spawning in Coho Creek, November through January; fry emerge from redds in March to June. Juveniles may be present in the study area year-round.
Cutthroat trout	TCS, SP	Cutthroat spawning has documented within Coho Creek; juveniles may rear in the study area and resident adults may be present year-round.
Pacific lamprey	TCS, SP	Documented during trapping activities in Coho Creek in 2004. Rearing habitat is present within the study area, but spawning habitat is currently limited.
Pink salmon	TCS, SP	Unknown; Coho Creek is mapped as gradient-accessible, but pink salmon were not found in Tulalip-monitored smolt traps in operation from 2002–2011.
Rainbow trout	TCS, SP	Unknown; not mapped within Coho Creek and were not found in Tulalip-monitored smolt traps in operation from 2002–2011.
River lamprey	TCS, SP, SC	Documented during trapping activities in Coho Creek in 2004. Rearing habitat is present within the study area, but spawning habitat is currently limited.
Olympic mudminnow	TCS, SP	Use of Coho Creek is unknown. However, suitable habitat is present. Areas of Ebey Slough were mapped as high suitability of Olympic mudminnow habitat.

[a] See discussion in the introduction to this subsection. Species listed under the ESA are discussed in the preceding three subsections of this document.

TCS= Tulalip Tribes culturally important species; FT= federally threatened; SC = candidate for state listing; SP = state priority species

3.2 Vegetation and Wildlife Resources

The vegetation study area includes a variety of cover types and wildlife habitats. Much of the study area consists of urban development, primarily commercial land use. These areas support wildlife species adapted to disturbed urban areas. However, undeveloped habitat within the Coho Creek corridor supports a variety of vegetation types and wildlife species. Vegetation conditions and wildlife habitats are described in the following subsections. Lists of plant and wildlife species known or expected to be present in the study area are included in Appendix B.

3.2.1 Vegetation

Vegetation in the study area was evaluated for the presence of rare plants and priority ecosystems through a review of the Natural Heritage program database (WDNR 2022). There are no documented occurrences of rare plants or priority ecosystems within the vegetation study area (extending 200 feet from the project footprint). The closest known rare plants and nonvascular species of high conservation value are mapped approximately 2,000 feet from the 4th Street project footprint (i.e., outside the study area for vegetation). This mapping includes four small polygons for rare species along the western edge of Quilceda Creek, within the estuarine wetland complex. These mapped plant species are not federally listed but do carry state-sensitive and state-threatened species status. Additionally, analysts evaluated vegetation in the study area and determined whether it provides essential habitat for plants considered culturally important to the Tulalip Tribes as listed under TTC 7.110.020. Culturally important species include cedar and ironwood.

Land cover in the entirety of the study area was classified and characterized according to the methods described in Section 2.2. Eleven cover types were identified in the study area. Their relative habitat value, occurrence, and description are presented in Table 2-1. Table 3-3 summarizes the acreage of each cover type in the study area, with separate subtotals for the study area around the 4th Street interchange and 88th Street NE interchange. Figures 3 and 4 in Appendix A map the distribution of habitat types in the study area around each interchange.

Table 3-3. Summary of Vegetation and Wildlife Habitats in the Study Areas

Cover/Habitat Type	Acreage in 4th Street Portion of Study Area	Acreage in 88th Street NE Portion of Study Area	Total Acreage
Emergent Wetland	0.00	1.55	1.55
Scrub-Shrub Wetland	0.00	1.30	1.30
Stream Channel	0.00	0.26	0.26
Riparian Forest	0.00	3.61	3.61
Upland Forest	1.59	0.90	2.48
Shrubland	0.60	1.31	1.91
Mown Grass and Landscaping	0.69	3.69	4.39
Roadside Right-of-way	7.51	8.70	16.21
Stormwater Facilities	0.05	0.25	0.30
Residential	0.00	2.29	2.29
Developed Unvegetated Surfaces	23.74	25.16	48.90

3.2.2 Terrestrial Wildlife

Overall, the unvegetated/road, grassland, mown grass, and developed commercial areas are the dominant cover/habitat types in the wildlife study area and as such provide low to moderate habitat value for wildlife. The emergent wetland areas and riparian habitat in the Coho Creek and Quilceda Creek corridors and Ebey slough estuary wetland represent the higher-value cover and habitat types important for wildlife. The Quilceda Creek and Coho Creek corridors provide food, cover, and nesting for species, including bald eagle, great blue heron, red-tailed hawk, belted kingfisher, red-legged frog, and mule deer (eBird 2022; Snohomish County 1999).

The study area for potential disturbance of wildlife extends over Ebey Slough, which is part of the Snohomish River estuary. Numerous species of birds, amphibians, and mammals are known to occupy habitats within the Snohomish River estuary and use them for foraging, breeding, and nesting. Species migrating to nesting grounds in the north or overwintering areas in the south also use these habitats as rest areas.

Wildlife observed during field visits include species typically habituated to human activities, such as rock pigeons, house sparrows, American robins, American crows, dark-eyed juncos, and Northern flickers.

3.2.2.1 Species and Habitats of Concern

Species of concern, defined as those with a regulatory status that prompts individual attention through federal, state, and/or local permitting processes, include the following:

- Species listed or proposed for listing as threatened or endangered under the ESA
- Essential habitat for animals considered culturally important to the Tulalip Tribes as listed under TTC 7.110.020

- Species that have established FWHCAs under local critical area rules
  - In the City of Marysville, areas designated as FWHCAs include the following:
    - Areas where any of the following species have a primary association: species listed as state endangered, state threatened, state sensitive, or state candidate, as well as species listed or proposed for listing by the USFWS or NMFS
    - State priority habitats and areas associated with state priority species
    - Habitats and species of local importance
- Bird species protected under the Migratory Bird Treaty Act or the Bald and Golden Eagle Protection Act

ESA-Listed Species

Based on reviews of information from the USFWS Information for Planning and Consultation website and guidance from WSDOT, analysts determined that the project has the potential to affect two ESA-listed species that may use terrestrial habitats in the study area. These species are the marbled murrelet and the Oregon spotted frog, both of which are listed as threatened. The following subsections summarize the status of these species in the study area, including the timing and nature of their use of habitats in the study area.

According to the USFWS Information for Planning and Consultation website, one additional ESA-listed species (yellow-billed cuckoo) and one species proposed for listing (North American wolverine) could potentially use habitats in the study area (USFWS 2023). Analysts reviewed the habitat requirements of those species and determined that there is no potential for project-related impact on either species. In addition, no critical habitat for any ESA-listed species is present in the study area.

Marbled Murrelet

USFWS listed marbled murrelets as threatened under the ESA in 1992 due to a decline in abundance and habitat degradation in the southern portion of their range (57 FR 45328, October 1, 1992). Marbled murrelets nest in mature and old-growth conifer-dominated forest, and they forage in nearshore marine waters. Marbled murrelet population declines have been attributed primarily to the loss and fragmentation of old-growth nesting habitat caused by logging and development (Ralph and Miller 1995). In addition, this species is vulnerable to fishing nets and oil spills (Marshall 1988).

WDFW (2022) does not report any observations of marbled murrelets in the study area. The closest suitable nesting habitat is located 15 miles east of the study area in the Cascade Mountains of eastern Snohomish County. The wildlife study area overlaps some nearshore marine habitats in Ebey Slough. Therefore, the study area includes some potential foraging habitat.

A 10-acre stand of mature conifer trees (older than 70 years) is adjacent to Coho Creek and directly south of 88th Street NE. Biologists searched portions of the stand for potential nest platforms and found none. It is impossible to state with certainty that no platforms are present within that stand. The probability is low, however. Habitat modeling performed for the 20-year review of the Northwest Forest Plan classified the stand as marginal habitat. Stands classified as marginal are considered unsuitable habitat for old-growth-associated species such as marbled murrelets (Davis et al. 2011). All forested areas near the project site have been logged multiple times in the past century and a half. Furthermore, the stand is dense, isolated, and surrounded by residential and commercial uses.

Oregon Spotted Frog

USFWS listed Oregon spotted frogs as threatened under the ESA on August 29, 2014 (79 FR 51658). Oregon spotted frogs are associated with large, emergent freshwater wetlands, typically larger than 10 acres (Pearl and Hayes 2004). Breeding occurs in February or March at lower elevations. Females deposit egg masses in shallow, often temporary, pools generally no more than 6 inches deep. Eggs usually hatch within 3 weeks, and the tadpoles metamorphose into froglets during their first summer (Leonard et al. 1993).

The closest known extant population of Oregon spotted frogs is along the Samish River in Skagit and Whatcom Counties, approximately 30 miles north of the study area. In addition, Tulalip tribal biologists have conducted field work in wetlands throughout the watershed, but they have not observed any Oregon spotted frogs during that work (Warner 2022, personal communication; Nelson 2022a, personal communication). Nevertheless, guidance developed by WSDOT (2015) indicates that potentially suitable habitats in the Quilceda Creek-Frontal Possession Sound watershed have the potential to support populations of Oregon spotted frogs.

The Coho Creek wetland complex near the 8th Street NE crossing contains potentially suitable breeding, rearing, and overwintering habitat for Oregon spotted frogs. Habitat features that provide potentially suitable habitat for breeding and rearing include inundation for at least 4 months per year, shallow water areas (less than 12 inches deep) with sun exposure, gradual topographic gradient from shallow water toward deeper, permanent water, and predominantly herbaceous wetland vegetation (WSDOT 2015). Given the proximity of forest cover and the predominance of dense, monocultural stands of reed canarygrass, habitats near the project site are unlikely to provide suitable oviposition sites for Oregon spotted frogs. Inundation of the Coho Creek wetland complex between October and March indicates the presence of potentially suitable overwintering habitat (WSDOT 2015).

Migratory Bird Treaty Act

The Migratory Bird Treaty Act of 1918, administered by USFWS, makes it unlawful to take, import, export, possess, sell, purchase, or barter any migratory bird, with the exception of the taking of game birds during established hunting seasons. The term, *take*, in this context, includes mortality or capture of migratory birds that directly and foreseeably results from an action. The law also applies to feathers, eggs, nests, and products made from migratory birds. Nearly all bird species that may occur in the study area are protected under the Migratory Bird Treaty Act. All habitats in the study area support migratory birds of some type at some time in their life cycle; therefore, all habitats identified above would be considered habitat for migratory birds.

Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (16 U.S.C. §§ 668-668c) prohibits the take of bald or golden eagles, including their parts, nests, or eggs, unless allowed by a permit issued by the Secretary of the Interior (16 U.S.C. § 668(a); 50 CFR part 22). The Bald and Golden Eagle Protection Act and implementing regulations define take as “pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest or disturb.” Activities that disturb vegetation or generate noise or human activity near an active nest (generally, 660 feet or closer) may require an incidental take permit. No eagle nests have been identified within 660 feet of the project footprint.

Other Wildlife Species of Concern

In addition to the ESA-listed species discussed above, several species that may use terrestrial habitats in the study area have state listing status or are considered culturally important to the Tulalip Tribes. Animal species identified as culturally important to the Tulalip Tribes include fish, eagles, hawks, falcons, owls, deer, and bears (TTC 7.110.020). Based on a review of the distribution and habitat associations of species with tribal, federal or state status, Table 3-4 identifies species that may use habitats in the study area, along with each species' regulatory status and a description of the species' use of habitats in the study area.

Table 3-4. Wildlife Species of Concern That May Use Habitats in the Study Area

Species	Status	Habitat Use in Study Area
Amphibians		
Oregon spotted frog	FT	Wetlands within the study area may provide potentially suitable breeding, rearing, and overwintering habitat.
Western toad	SC, SP	No recent records. May breed in permanent wetlands, ponds, lakes, and off-channel habitats or rivers; adults may move up to a few miles through uplands.
Birds		
Marbled murrelet	FT	Unlikely to inhabit the study area. The closest suitable nesting habitat is located 15 miles east of the study area
Bald eagle	TCS, SP	Common year-round within study area. No known nests within 660 feet of project footprint.
Red-tailed hawk	TCS	Nesting and foraging habitat is present within the Coho Creek riparian corridor.
Cooper's hawk	TCS	Nesting and foraging habitat is present within the Coho Creek riparian corridor.
Sharp-shinned hawk	TCS	Nesting and foraging habitat is present within the Coho Creek riparian corridor.
Western screech owl	TCS	Nesting and foraging habitat is present within the Coho Creek riparian corridor.
Northern saw-whet owl	TCS	Nesting and foraging habitat is present within the Coho Creek riparian corridor.
Northern pygmy owl	TCS	Nesting and foraging habitat is present within the Coho Creek riparian corridor.
Band-tailed pigeon	SP	Fairly common during breeding season, occasionally seen at other times; breeding possible. Nests in trees, often favoring open sites bordered by tall conifers. Mineral springs provide important nutrients.
Barrow's goldeneye	SP	Occasional visitor to Snohomish River estuary.
Brant	SP	Occasional visitor to Snohomish River estuary.
Common goldeneye	SP	Fairly common visitor to Snohomish River estuary.
Common loon	SS, SP	Fairly common visitor to Snohomish River estuary.
Great blue heron	SP	Common year-round in Snohomish Estuary and Coho Creek corridor; breeding possible. Nests in mature forests, forages in shallow, slow-moving or still calm water.
Hooded merganser	SP	Common year-round; breeding possible. Nests in tree cavities near small, forested, freshwater wetlands with emergent vegetation. Low-elevation freshwater lakes, ponds, sloughs, and slow-moving rivers are all used.

Table 3-4. Wildlife Species of Concern in the Study Area (continued)

Species	Status	Habitat Use in Study Area
Peregrine falcon	TCS, SP	Occasionally seen at all times of year. No nesting habitat (cliffs and cliff-like structures) nearby.
Pileated woodpecker	SC, SP	Occasionally seen year-round; breeding possible. Requires forested habitats with large trees and snags.
Purple martin	SC, SP	Uncommon during breeding season. Nests in tree cavities or artificial structures over water; feeds over open land near water. Regularly seen within Snohomish River estuary.
Trumpeter swan	SP	Fairly common winter visitor to Snohomish River estuary.
Tundra swan	SP	Common winter visitor to Snohomish River estuary.
Vaux's swift	SC, SP	Common during breeding season; breeding possible. Nests and roosts in natural cavities with vertical entranceways, such as hollow trees and snags, in areas of coniferous or mixed forest.
Western grebe	SC, SP	Common winter visitor to Snohomish River estuary.
Wood duck	SP	Common in summer, uncommon during winter; breeding possible. Nests in tree cavities near wooded wetlands and slow-moving, tree-lined rivers.
Mammals		
Black bear	TCS	Potential foraging habitat is present within more undisturbed areas of the Coho Creek riparian corridor.
Mule deer	TCS	Potential browsing habitat is present along the edges of the riparian forest.
Big-brown bat, *Myotis* bats	SP	No known maternity or hibernation colonies or other concentrations in or near the study area. Summer roosts generally are in buildings, bridges, hollow trees, spaces behind exfoliating bark, rock crevices, or tunnels. Maternity colonies may form in attics, barns, rock crevices, or tree cavities. Caves, mines, and buildings are used for hibernation.
Townsend's big-eared bat	SC, SP	No known maternity or hibernation colonies or other concentrations in or near the study area. Maternity and hibernation colonies typically are in caves, mine tunnels, and old buildings. Caves, tunnels, buildings, and tree cavities are used as night roosts.

[a] See discussion in the introduction to this subsection. Species listed under the ESA are discussed in the preceding three subsections of this document.

TCS= Tulalip Tribes culturally important species; FT= federally threatened; SC = candidate for state listing; SP = state priority species

3.3 Wetland Resources

One wetland (Wetland A) was identified in the 88th Street NE area and none were identified within the 4th Street study area. Wetland A is located within the Coho Creek riparian corridor, west of I-5 in the 88th Street NE project footprint. Characteristics of the wetland are described in Section 3.3.1. The mapped location of the wetland and the delineated boundaries are shown in Figure 2 in Appendix A. A summary of wetland characteristics is included in Table 3-5 below.

Table 3-5. Summary of Wetlands in the Study Area

Wetland	Area (acres)[a]	USFWS Classification[b]	HGM Classification[c]	Ecology Rating (2014)[d]	Local Jurisdiction Category[e]	Standard Buffer Width (feet)[f]
Wetland A	2.85	PSS/PEM	Riverine	I	I	200

[f] TTC 7.110.070

HGM = hydrogeomorphic; PSS = palustrine scrub-shrub; PEM = palustrine emergent

3.3.1 Wetland Descriptions

3.3.1.1 Wetland A

Size: 2.85 acres
Tulalip Tribe Rating: Category I
USFWS Classification: Palustrine Scrub-Shrub/Palustrine Emergent
Hydrogeomorphic Classification: Riverine

The one wetland identified within the study area, referred to as Wetland A, is a riverine wetland with palustrine scrub-shrub and emergent habitats (Brinson 1993; FGDC 2013). The wetland is located within the Coho Creek riparian corridor west of the 88th Street NE interchange. Overbank flooding from Coho Creek and a high groundwater table support wetland hydrology. USDA maps the soil in the riparian corridor as Norma loam and the upper elevations outside the riparian corridor both east and west of Coho Creek as Ragnar fine sandy loam (USDA 2022a).

Six wetland sample plots were recorded in Wetland A. Sample plot WLA-SP6 is representative of typical Wetland A soil conditions. The top layer, 0 to 7 inches, was a black (10YR 2/1) silty loam. Beneath this layer, from 7 to 18 inches soils, were dark grayish brown (10YR 4/2) with dark yellowish brown (10YR 4/6) and dark reddish brown (10YR 3/4) redoximorphic features and a sandy loam texture. This sample plot met the indicators for depleted below dark surface (A11) and depleted matrix (F3) hydric soil. Additional hydric soil indicators present within Wetland A at other sample plots include redox dark surface (F6) and histosol (A1).

The scrub-shrub stratum of Wetland A consists primarily of red-osier dogwood, salmonberry, black twinberry, and willow species. The emergent portion of the wetland is dominated by reed canarygrass and spotted jewelweed. Additional emergent vegetation includes common cattail, field horsetail, and lady fern.

Wetland A was functionally rated using the riverine hydrogeomorphic class (Hruby 2014). The wetland scored 23 points on the Ecology rating form and is rated as a Category I wetland, with 8 points for water quality, 7 points for hydrologic functions, and 8 points for habitat functions (Hruby 2014). According to Tulalip Tribal Code 7.110.070, Wetland A is classified as a critical value freshwater wetland and receives a buffer of 200 feet.

4. ENVIRONMENTAL CONSEQUENCES

This chapter describes the expected temporary and permanent effects of the No Action and the Proposed Action alternative for the I-5/4th Street and 88th Street NE Corridor Improvements project on the following resources:

- Aquatic Resources (Section 4.1)
- Vegetation and Wildlife Resources (Section 4.2)
- Wetland Resources (Section 4.3)

Project impacts of the Proposed Action are shown in Figure 2 in Appendix A. Overall, implementation of the Proposed Action would likely have a net benefit for ecosystem resources in Coho Creek and its associated riparian complex. This would be achieved by improving fish passage, realigning Coho Creek and adding in-stream habitat features, enhancing the riparian buffer, and gaining wetland habitat in place of road fill. No net loss of wetland and stream habitat is anticipated as a result the project. Only riparian and wetland buffer would be permanently impacted and subsequently mitigated appropriately. Any areas of temporary riparian buffer impact would be restored in-place with native woody species. The discussion of project impacts assumes that best management practices (BMPs) be implemented and would perform as expected to avoid and minimize certain impacts during construction. For potential mitigation measures, see Chapter 5.

4.1 Aquatic Resources

4.1.1 Effects of the No Action Alternative

Under the No Action Alternative, there would be no project-related changes to the current water quality or hydrology of Coho Creek or the riparian corridor. No potential temporary or permanent degradation of water quality (such as sedimentation, turbidity, or toxicants) would occur, and there would be no additional stormwater inputs to streams. There would be no potential for fish mortality resulting from fish exclusion work. The stream would remain in its current alignment and conveyance through an undersized culvert. There would be no potential for fish passage improvement or the creation of additional riparian habitat in place of the existing undersized culvert and roadway fill prism. Access by fish to restored sections of Coho Creek upstream of the project area would remain uncertain. No in-stream or riparian improvements, including invasive species removal and large woody material placement, would occur.

4.1.2 Effects of the Proposed Action

This section considered the following potential impacts on aquatic resources:

- Permanent habitat loss
- Beneficial impacts associated with in-stream and riparian restoration and replacing the culvert with a bridge
- Direct fish mortality associated with fish exclusion work during channel realignment
- Temporary degradation of habitat (sedimentation and removal of riparian vegetation)
- Temporary or permanent degradation of water quality (turbidity, temperature, toxicants)

Table 4-1 below identifies the temporary and permanent impacts anticipated to streams and their associated buffers. The impact areas are shown in Figure 5 in Appendix A. The riparian buffer impacts described in this report refer to the combined wetland and stream buffer of 200 feet for the Coho Creek corridor.

Table 4-1. Summary of Temporary and Permanent Impacts on Streams (in acres)

Stream	Permanent Impact	Temporary Impacts	Aquatic Conversion Area[1]	Permanent Buffer	Temporary Buffer
Coho Creek	0.02	0.09	0.01	0.32	0.23

[1] This area includes existing stream habitat converted to wetland and is considered self-mitigating after stream restoration construction work is complete.

4.1.2.1 Permanent Impacts and Aquatic Area Conversion

Realigning the stream channel and building bridge piers and retaining walls would entail the placement of fill (0.02 acre) below the OHWL of Coho Creek. The impacts of aquatic habitat loss in these areas would be offset by (1) the creation of new stream channel habitat combined with (2) the removal of the gabion-supported road fill prism that currently occupies areas that would otherwise be within the OHWL of Coho Creek and/or within associated wetland and riparian areas. As mentioned in Section 3.1.1, the Tulalip Tribes have implemented extensive habitat improvement projects in Coho Creek, and the Tribes are developing plans for additional restoration. Removal of the undersized culvert at 88th Street NE would render those areas more accessible to anadromous salmonids, including ESA-listed species.

Approximately 160 linear feet of existing stream channel would be converted to wetland upstream and downstream of the 88th Street NE culvert. In its place, approximately 220 linear feet of new stream channel would be created, for a net gain of about 60 linear feet. To realign the stream channel, 0.01 acre of stream would be filled to match the gradient of the existing wetland. This is considered a self-mitigating aquatic area conversion. Approximately 0.02 acre of stream habitat would be gained as a result of the stream realignment.

Stream realignment would also result in the loss of some wetland areas. As with stream channel habitat, these losses would be offset. Approximately 0.08 acre of Wetland A would be affected by fill placement and 0.01 acre of the wetland would be affected by aquatic area conversion associated with stream realignment. However, approximately 0.13 acre of gabion-supported road fill prism would be removed, replaced with native soils, graded to meet wetland and OHWL elevations, and restored with native vegetation. Over time, this area is expected to support wetland and riparian functions, potentially resulting in a net increase of approximately 0.05 acre of wetland area at the project site. In addition, all impacts to wetlands, streams, and their regulatory buffers would be mitigated in accordance with applicable tribal, federal, state, and local requirements. There would be no net loss of wetland or stream area or ecological functions. The project is expected to result in a substantial improvement in system processes and ecological functions of wetlands and streams after fill removal associated with the bridge construction.

In addition to improving fish access, adding large woody material, and replacing the gabion-supported road prism with native riparian vegetation, the project would have the following beneficial effects:

- Increased availability of potentially suitable spawning substrates in the newly constructed channel
- Improved connectivity between the stream and its floodplain where the existing gabion-supported road fill prism is removed
- Improved movement of sediments through the system due to stream channel realignment and removal of the undersized culvert

By reducing the total area of impervious surfaces in the study area, the project would help restore flow regimes in streams that receive runoff from project-related surfaces. During storm events, more water would infiltrate into the ground instead of discharging to streams, thereby reducing sudden increases in stream flow that can harm aquatic species and habitat. Increased infiltration would also contribute to groundwater recharge, helping maintain stream flows during periods of low precipitation.

In addition, the project would include stormwater treatment facilities designed to accommodate runoff from impervious surfaces that are added, replaced, or modified for project construction. The stormwater design for this project exceeds the guidelines in the 2024 Stormwater Management Manual for Western Washington (Ecology 2024), which represents the best available science for stormwater treatment and flow control. The stormwater design employs underground treatment vaults to remove contaminants (including 6PPD-quinone, petrochemicals, and metals) before runoff enters surface waters or above-ground stormwater facilities (e.g., bioswales, infiltration ponds).

These project elements are expected to reduce the potential for aquatic species to be exposed to elevated concentrations of pollutants (including dissolved metals and other chemical contaminants) in runoff from impervious surfaces created or replaced by the project. Even with these measures, it is possible that some residual contaminants may be present in runoff that leaves the project area. These contaminants may be toxic to fish and other aquatic species. The potential for adverse effects on ESA-listed fish, designated critical habitat, and EFH is evaluated in the biological assessment that was prepared to support consultation under the ESA and the Magnuson-Stevens Fishery Conservation and Management Act (Parametrix 2022b).

Removal of the undersized culvert may reduce the amount of area affected by backwatering during high-flow events in Coho Creek. Based on low gradients, abundant beaver activity, and groundwater availability in Wetland A upstream of 88th Street NE, this change would not be expected to affect the hydrology of Wetland A. Modeling indicates that the project would not affect the water surface elevation in Coho Creek during a 2-year storm event. Measurable changes in water surface elevations would occur only during significantly larger storm events, which do not play a major role in determining wetland hydrology. For these reasons, the total area of Wetland A is not expected to change. Over the long term, the proposed habitat improvements in Coho Creek would benefit aquatic species by increasing the amount of available habitat, improving habitat complexity, maintaining riparian cover and water quality, and increasing the prey base.

4.1.2.2 Temporary Impacts

Bridge construction (including construction of a temporary access road at the bridge site) and stream channel realignment would entail clearing vegetation in the riparian zone along Coho Creek. Under current conditions, vegetation in the affected areas consists primarily of invasive species such as Himalayan blackberry and reed canarygrass. Temporarily disturbed areas in the riparian zone would be

replanted with native species that support riparian ecological functions. The removal of invasive species and replanting with appropriate native species would likely contribute to improved riparian habitat quality over time. In addition, approximately 0.13 acre of gabion-supported road fill prism would be replaced with native soils and native vegetation, increasing the amount of area that provides riparian ecological functions.

Construction of the temporary access road would also entail the placement of fill below the OHWL of Coho Creek (Table 4-1). This fill would be removed after construction is complete, and the wetland and stream habitats would be restored in place with native woody vegetation. This area of temporary impact is currently degraded and dominated by invasive reed canarygrass.

Safety standards require that only low-stature species be allowed to grow within 10 feet of the new bridge. Mature forest habitat would not develop in those areas, reducing the potential for recruitment of large woody material to the stream over the long term. This reduction would be offset by the placement of more than 60 pieces of large woody material in and near the stream as part of the project design.

The proposed project would include the temporary disturbance of soils during grading and excavating activities. Site grading and excavation could result in erosion from disturbed upland soils, potentially increasing the sediment load in runoff entering Coho Creek. Stream reconstruction activities in Coho Creek may mobilize existing bottom sediments and sediments within the existing culvert, leading to short-term increases in turbidity and sedimentation of downstream areas. Based on the implementation of site-specific BMPs, the effects of sedimentation and turbidity in Coho Creek are anticipated to be minimal. In addition, the likelihood of any ESA-listed fish being present in Coho Creek during construction is extremely low. As discussed in Section 3.1.2, Chinook salmon, steelhead, and bull trout are not expected to spawn in Coho Creek. In the unlikely event that any of these species do spawn in Coho Creek, work in and near the water would take place during the in-water work window (July 15 to September 30), when migrating adults, incubating eggs, and outmigrating juveniles are least likely to be present. No in-water work would be performed outside that window without prior review and approval by Tulalip Tribal staff.

It is possible that rearing juvenile Chinook salmon or steelhead or foraging subadult bull trout could enter Coho Creek from Quilceda Creek. The probability of this occurring is very low, however, based on the following:

- During 10 years of monitoring at the smolt trap in Coho Creek approximately 0.4 mile upstream from the project site, none of these species was observed.
- The in-water work window corresponds to the period when low flows and elevated water temperatures are expected to discourage individuals of all three species (especially bull trout) from entering Coho Creek.
- Bull trout are not expected to spawn in the Quilceda Creek system, further reducing the likelihood that adults, subadults, or juveniles may venture into Coho Creek from Quilceda Creek.
- Juvenile Chinook salmon from the Quilceda Creek system are predominantly ocean-type—that is, they migrate downstream from April to early June and are largely absent from fresh waters by mid-July.
- Tulalip tribal biologists familiar with local conditions have determined that all three species are unlikely to be present in Coho Creek during the in-water work window (Nelson 2022a, personal communication).

Fish exclusion would occur during the in-water work window established by the Tribes (July 15 to September 30) and in compliance with the WSDOT and USFWS fish exclusion protocol and standards (2021a; 2012). As noted above, in the unlikely event that Chinook salmon, steelhead, or bull trout spawn in Coho Creek, this work would take place when migrating adults, incubating eggs, and outmigrating juveniles are least likely to be present. Also, as discussed above, the probability that individuals of any of these species might venture into the construction area during the in-water work window is very low. Performing the work during the fish window would also minimize the risk to other fish species potentially in the study area, including cutthroat trout, coho salmon, and chum salmon.

4.2 Vegetation and Wildlife Resources

4.2.1 Effects of No Action Alternative

Under the No Action Alternative, there would be no temporary or permanent project-related impacts to existing vegetation and wildlife habitats. There would be no conversion of vegetated areas to impervious surfaces and no impacts to significant trees. There would be no changes to trees and shrubs within riparian corridor of Coho Creek. Patches of invasive Himalayan blackberry along the existing roadway fill prism would not be removed for project construction.

4.2.2 Effects of the Proposed Action

This section considered the following potential impacts on vegetation and wildlife resources:

- Permanent impacts associated with the clearing and paving of vegetation and wildlife habitats
- Temporary impacts associated with clearing and staging of equipment
- Permanent and temporary impacts to significant trees in the study area
- Impacts to essential habitat for animals and/or plants considered culturally important to the Tulalip Tribes, as listed under TTC 7.110.020

Construction of the corridor improvements project would result in temporary and permanent impacts to vegetation and wildlife within the study area. As described in Section 1.6, the study area for vegetation cover and habitat types extends 200 feet from the project footprint (see Figures 3 and 4 in Appendix A). Table 4-2 below summarizes the impacts per vegetation cover type. A total of 29 significant trees would be removed within the study area (14 trees within permanent impact areas and 15 within temporary impact areas). Twenty-two of these trees are within the Tulalip Reservation and seven are within the City of Marysville.

Table 4.2 Summary of Temporary and Permanent Impacts on Vegetation and Wildlife Habitats (in acres)

TOTAL	**6.44**	**1.38**	**8.69**	**2.50**	**15.13**	**3.88**

4.2.2.1 Permanent Impacts

Within the 4th Street portion of the study area, vegetation and wildlife habitats would be permanently displaced by the project through conversion to paved surfaces. Most of the area within the permanent impact area consists of unvegetated surfaces, such as roads, parking lots, and commercial or industrial lands (Table 4-2). Vegetated areas make up a small portion of the cover in the permanent impact area. Vegetation that would be affected consists primarily of the disturbed roadside right-of-way cover type, with smaller amounts of upland forest and mown grass/landscaping. Affected upland forest vegetation consists primarily of conifer trees near the I-5/4th Street and directly east of I-5 adjacent to commercial businesses. These trees may provide structural habitat for birds and other wildlife, but the disturbance level is very high given the proximity to major highways and roads.

As mentioned in Section 2.2.2 of this report, trees with a diameter of 8 inches or greater (as measured 4 feet above grade) are classified as significant trees for this analysis. Seven trees identified as significant trees within the 4th Street project footprint would be permanently removed during project construction. All seven are conifer trees located in upland areas near the northbound and southbound I-5 on-ramps within the City of Marysville. West of I-5, within the Tulalip Reservation, all of the impacted vegetated areas are disturbed roadside right-of way, shrubland, and landscaped areas. These habitat types do not offer essential habitat for species considered culturally important to the Tulalip Tribes, as listed under TTC 7.110.020.

Similar to the 4th Street portion of the study area, most of the land cover in the permanent impact area in the 88th Street NE portion of the study area consists of unvegetated areas, and most of the affected vegetation consists of the disturbed roadside right-of-way cover type. The other cover types in the permanent impact area are emergent wetland, scrub-shrub wetland, stream channel, upland forest, shrubland, mown grass/landscaping, and stormwater facilities. Impacts to areas classified as stream channel and wetland would be mitigated in accordance with applicable tribal, federal, state, and local requirements.

Five significant trees within Wetland A would be permanently removed to construct the new bridge. These trees are fast-growing deciduous red alder and willow trees. These trees do not provide nesting habitat for culturally important bird species, such as hawks and eagles, and are near the road fill prism. Additionally, eleven significant trees (all conifer trees) within the landscaped area and riparian forest near the 34th Ave and 88th Street NE intersection would be removed for the road realignment and temporary construction access road. Trees adjacent to the cleared areas will be protected through the use of silt fencing and additional BMPs. See Figure 2 in Appendix A for the locations of these significant trees.

4.2.2.2 Temporary Impacts

Project construction would require clearing and removing vegetation in the temporary impact area. Outside of areas where roadside vegetation maintenance standards require the planting of grasses or other low-growing species, temporarily disturbed areas would be replanted with native species. Temporary staging areas would be located within previously developed areas (roads) and would not require vegetation clearing.

Most of the land cover in the temporary clearing area in the 4th Street portion of the study area consists of developed unvegetated surfaces or roadside right-of-way vegetation (Table 4-2). Small areas of upland forest, shrubland (primarily invasive Himalayan blackberry), and mown grass/landscaping are also present. No significant trees would be temporarily impacted.

Similar to the 4th Street portion of the study area, most of the land cover in the temporary clearing area in the 88th Street NE portion of the study area consists of developed unvegetated surfaces or roadside right-of-way vegetation (Table 4-2). Other cover types in the temporary impact area include riparian forest, upland forest, shrubland, mown grass/landscaping, and stormwater facilities. Construction of the temporary access road would temporarily impact areas of stream channel, scrub-shrub wetland, and emergent wetland land cover. Fill placed for the temporary access road would be removed, and the wetland and stream habitats would be restored in place with native woody vegetation after project construction is complete. Two significant trees (red alders) would be temporarily impacted within the riparian buffer. These trees are near 34th Ave NE and offer little habitat for wildlife. Additionally, four significant trees would be temporarily impacted within landscaped areas east of the 34th Ave and 88th Street NE intersection.

Construction activities would temporarily affect wildlife in and near the project site. Impacts would occur from vegetation and habitat loss, disruption of travel corridors, noise impacts, and displacement of wildlife into potentially less suitable habitats where they might not thrive. Wildlife would likely be displaced when construction begins. Species displaced by construction noise would likely return after construction is complete. However, reestablishing native vegetation would require months to years for herbaceous upland and wetland types, and years to decades for forests.

4.3 Wetland Resources

4.3.1 Effects of the No Action Alternative

Under the No Action Alternative, there would be no permanent or temporary project-related impacts to wetlands in the study area. The vegetation and hydrology conditions would remain the same, and wetland soils would remain intact. There would be no improvements to habitat structure within Wetland A. There would be no potential for the creation of additional wetland and riparian habitat area in place of the existing roadway fill prism.

4.3.2 Effects of the Proposed Action

Permanent and temporary impacts to wetlands resulting from construction of the corridors improvement project are listed in Table 4-3 and discussed in the sections above.

Approximately 0.08 acre of Wetland A would be permanently filled as a result of the project. Fill placed within Wetland A for the temporary construction access road (totaling 0.09-acre) will be removed and the wetland will be restored in place with native woody vegetation after project construction is complete. This area of temporary impact is currently degraded and dominated by invasive reed canarygrass. After stream restoration efforts are complete, 0.01 acre of riverine wetland habitat would be converted to stream habitat, and 0.01 acre of stream habitat would be converted to wetland. These impacts are regarded as a self-mitigating conversion of aquatic habitat type to another. Additionally, approximately 0.13 acre of gabion-supported road fill prism would be removed, replaced with native soils, graded to meet wetland and OHWL elevations, and restored with native vegetation. Over time, this area is expected to support wetland and riparian functions, potentially resulting in a net increase of approximately 0.05 acre of wetland area at the project site. Overall, the project is expected to result in no net losses of wetland areas or functions.

Table 4-3. Temporary and Permanent Impacts to Wetlands and Their Buffers

Wetland	Vegetation Type	Permanent Impacts	Temporary Impacts	Aquatic Area Conversion[3]	Permanent Buffer Impacts	Temporary Buffer Impacts
A	PSS/PEM	0.08[1]	0.09[2]	0.01	0.32	0.23

[1] This total includes 0.02 acre of wetland below the OHWL; therefore, it is also considered stream impact and included in Table 4-1.

[2] This total includes 0.09 acre of wetland below the OHWL; therefore, it is also considered stream impact and included in Table 4-1.

[3] This area consists of existing wetland habitat that would be converted to stream and is considered self-mitigating after stream restoration construction work is complete.

PEM = palustrine emergent; PSS = palustrine scrub-shrub

5. POTENTIAL MITIGATION MEASURES

The I-5/4th Street and 88th Street NE Corridor Improvements Project is being designed to comply with all federal, state, and local regulations. Although the Tulalip Tribal Code does not have prescribed mitigation ratios, the project team coordinated with tribal biologists to ensure the mitigation approach would meet the goals and intents of the code.

The project would use a mitigation sequencing approach based on a hierarchy of avoiding and minimizing adverse impacts through careful design, implementing BMPs, and rectifying temporary impacts. Applicable BMPs would be implemented during project construction and operation.

As mentioned previously, there would be no net loss of wetland or stream habitat associated with the project. The project is expected to provide a net gain in ecological functions in Coho Creek and associated wetlands.

Impacted riparian areas coincide with impacted wetland buffer areas. For this reason, all buffer impacts (i.e., impacts to stream buffers and to wetland buffers) are referred to as impacts to riparian areas. All temporarily impacted riparian areas (totaling 0.23 acre) would be restored in place with native woody vegetation after project construction is complete. These areas are currently dominated by invasive species, which supports fewer ecological functions than the native woody species that would be used for site restoration.

Compensatory mitigation would be provided for all permanently impacted riparian areas. Several riparian habitat mitigation areas have been identified in the project vicinity. Currently, these areas are dominated by invasive Himalayan blackberry and one area of knotweed previously treated by the Tulalip Tribes. The blackberry and remaining knotweed would be removed, and the areas would be replanted with a variety of native trees and shrubs that support riparian functions and offer increased plant diversity for wildlife. The total extent of permanent riparian impacts is 0.32 acre, and the combined size of the riparian habitat mitigation areas is 0.48 acre. The project would thus achieve a mitigation ratio of 1.6:1 for riparian impacts, exceeding the guideline of a 1:1 mitigation ratio. See Figure 6 in Appendix A for the location of the proposed buffer mitigation areas.

Based on the anticipated net gains in the area and ecological functions of streams, riparian habitat, and wetlands, additional compensatory mitigation for project impacts on ecosystem resources is not expected to be required. The final mitigation measures would include specific goals and objectives and would specify monitoring criteria that proposed mitigation measures could be compared against. Mitigation measures would be generally described in enough detail so that reviewing agencies can determine the likelihood of the proposed mitigation succeeding and meeting all stated objectives.

Scientific Names of Species Identified in This Report

Plants

Common Name	Scientific Name
Black twinberry	*Lonicera Involucrata*
Common cattail	*Typha latifolia*
Field horsetail	*Equisetum arvense*
Himalyan blackberry	*Rubus armeniacus*
Ironwood/Oceanspray	*Holodiscus discolor*
Lady fern	*Athyrium cyclosorum*
Red alder	*Alnus rubra*
Red-osier dogwood	*Cornus sericea*
Reed canarygrass	*Phalaris arundinacea*
Salmonberry	*Rubus spectabilis*
Spotted jewledweed	*Impatiens capensis*
Western redcedar	*Thuja plicata*
Willow spp.	*Salix spp.*

Animals

Common Name	Scientific Name
American crow	*Corvus brachyrhynchos*
American robin	*Turdus migratorius*
Bald eagle	*Haliaeetus leucocephalus*
Band-tailed pigeon	*Patagioenas fasciata*
Barrow's goldeneye	*Bucephala islandica*
belted kingfisher	*Megaceryle alcyon*
Big-brown bat	*Eptesicus fuscus*
Black bear	*Ursus americanus*
Brant	*Branta bernicla*
Bull trout	*Salvelinus confluentus*
Chinook salmon	*Oncorhynchus tshawytscha*
Chum salmon	*Oncorhynchus keta*
Coho salmon	*Oncorhynchus kisutch*
Common goldeneye	*Bucephala clangula*
Common loon	*Gavia immer*
Cooper's hawk	*Accipiter cooperii*
Cutthroat trout	*Oncorhynchus clarkii*
Dark-eyed junco	*Junco hyemalis*
House sparrow	*Passer domesticus*
Great blue heron	*Ardea herodias*
Hooded merganser	*Lophodytes cucullatus*
Marbled Murrelet	*Brachyramphus marmoratus*
Mule deer	*Odocoileus hemionus*
North American beaver	*Castor canadensis*
Northern flicker	*Colaptes auratus*
Northern pygmy owl	*Glaucidium californicum*

Northern saw-whet owl	*Aegolius acadicus*
Olympic Mudminnow	*Novumbra hubbsi*
Oregon Spotted Frog	*Rana pretiosa*
Pacific lamprey	*Lampetra tridentata*
Peregrine falcon	*Falco peregrinus*
Pileated woodpecker	*Dryocopus pileatus*
Pink salmon	*Oncorhynchus gorbuscha*
Purple martin	*Progne subis*
Rainbow trout	*Oncorhynchus mykiss*
red-legged frog	*Rana aurora*
Red-tailed Hawk	*Buteo jamaicensis*
River lamprey	*Lampetra ayresi*
Rock pigeon	*Columba livia*
Sharp-shinned hawk	*Accipiter striatus*
Steelhead	*Oncorhynchus mykiss*
Townsend's big-eared bat	*Corynorhinus townsendii*
Trumpeter swan	*Cygnus buccinator*
Tundra swan	*Cygnus columbianus*
Vaux's swift	*Chaetura vauxi*
Western grebe	*Aechmophorus occidentalis*
Western screech owl	*Megascops kennicottii*
Western toad	*Anaxyrus boreas*
Wood duck	*Aix sponsa*

Executive Summary

The Tulalip Tribes (Tribes), in partnership with the Washington State Department of Transportation (WSDOT), Snohomish County, and the City of Marysville, propose to develop and implement access improvements to two interchanges on the Interstate 5 (I-5) corridor within the boundary of the Tulalip Reservation in Snohomish County, Washington. The two interchanges are at 4th Street (also known as State Route 528 and Marine Drive) and 88th Street NE.

The purpose of the I-5/4th Street and 88th Street Corridor Improvements Project is to support community and economic vitality by reducing congestion and improving mobility for cars, trucks, emergency services, pedestrians, and transit users traveling to, from, and across I-5 on 4th Street and 88th Street NE and within the Tribes' Reservation while enhancing safety and protecting the integrity of the interstate system.

The federal nexus for this project is approvals by the Bureau of Indian Affairs (BIA) for expansion of existing road rights of way on tribal lands.

Project construction is expected to require two (2) years, with an anticipated start date of January 2024. All construction activities below the ordinary high-water lines of streams will occur during the in-water work window established by the Tribes (July 15 through September 30).

The project includes the following elements:

- Construction of seven roundabouts to replace existing signaled intersections
- Channelization improvements entering and exiting the roundabouts
- Reconfigured pedestrian and bicycle access along the alignment
- Construction of new flow control and water quality treatment facilities for runoff from new and replaced impervious surfaces
- Construction of a bridge to replace the existing road fill prism and an undersized culvert on Coho Creek at 88th Street NE
- Habitat improvements (including placement of new streambed substrates and large woody material) in Coho Creek near the new bridge crossing

ESA-listed species and critical habitats addressed in this analysis are identified in Table ES-1. Project activities with the greatest potential to affect those species and habitats include construction activities in and near habitats where ESA-listed species may be present and the creation or replacement of impervious surfaces from which contaminants in stormwater may run off to waters where ESA-listed species are present. No ESA-listed wildlife species are expected to be present in the action area while construction activities are underway, so the project is unlikely to affect those species. By limiting in-water work to the work window established by the Tribes, the project will minimize the potential for construction-related impacts on ESA-listed fish. Although runoff from all new or replaced impervious surfaces will be directed to facilities in which stormwater runoff will be treated and/or infiltrated, some residual contaminants may be present in runoff that leaves the project area. These contaminants may be toxic to ESA-listed fish, potentially resulting in adverse effects on those species and the critical habitat that has been designated for them (Table ES-1).

Table ES-1. ESA-Listed Species and Critical Habitat Addressed in this BA

Species	Status	Species Effect Determination	Critical Habitat Status	Critical Habitat Effect Determination
Chinook salmon (*Oncorhynchus tshawytscha*) (Puget Sound ESU)	Threatened	Likely to Adversely Affect	Designated within the action area	Likely to Adversely Affect
Steelhead (*Oncorhynchus mykiss*) (Puget Sound DPS)	Threatened	Likely to Adversely Affect	Designated within the action area	Likely to Adversely Affect
Bull trout (*Salvelinus confluentus*)	Threatened	Not Likely to Adversely Affect	Designated within the action area	Not Likely to Adversely Affect
Southern Resident killer whale (*Orcinus orca*)	Endangered	Not Likely to Adversely Affect	Designated; none in action area	N/A
Marbled murrelet (*Brachyramphus marmoratus*)	Threatened	Not Likely to Adversely Affect	Designated; none in action area	N/A
Streaked horned lark (*Eremophila alpestris strigata*)	Threatened	No Effect	Designated; none in action area	N/A
Yellow-billed cuckoo (*Coccyzus americanus*)	Threatened	No Effect	Designated; none in action area	N/A
Gray wolf (*Canis lupus*)	Endangered	No Effect	None designated	N/A
Oregon spotted frog (*Rana pretiosa*)	Threatened	Not Likely to Adversely Affect	Designated; none in action area	N/A

DPS = Distinct Population Segment; ESU = Evolutionarily Significant Unit

1. Introduction

The Tulalip Tribes (Tribes), in partnership with the Washington State Department of Transportation (WSDOT), Snohomish County and the City of Marysville (City), propose to develop and implement access improvements to two interchanges on the Interstate 5 (I-5) corridor within the boundary of the Tulalip Reservation. The two interchanges are at 4th Street (also known as State Route 528 and Marine Drive) and 88th Street NE.

Biologists from Parametrix, Inc., have prepared this biological assessment (BA) in accordance with Section 7(c) of the Endangered Species Act (ESA), to determine the project's potential impacts on listed species and their designated critical habitats and to support consultation with the U.S. Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS). This BA also includes an analysis of essential fish habitat (EFH) for the Pacific Salmon Fishery in accordance with the Magnuson-Stevens Fishery Conservation and Management Act (Magnuson-Stevens Act) (Appendix A).

1.1 Background and Consultation History

The Reservation of the Tulalip Tribes (Reservation) is accessed via three interchanges with I-5 along the eastern boundary of the Reservation. These interchanges are critically important to the Tribes for access to and from the Reservation. The only other access to the Reservation is via a single county road, 140th Street NE, at the northern boundary and via the waters of the Puget Sound and the Snohomish River. Goods, services, higher education, healthcare, jobs, and economic development depend on safe, efficient access to and from the Reservation.

Over the past several years, the Tribes have led substantial improvements at the 116th Street NE interchange at the northeast end of the Reservation. That project addressed capacity needs, congestion relief, and safety improvements for drivers, freight, nonmotorized users, and transit. The Tribes led and funded nearly all the planning, environmental documentation, design, permitting, and construction of these improvements through several phases of construction. The construction of the final phase of improvements at the interchange was completed in 2020.

The Tribes are now planning to develop and implement access improvements to the remaining two interchanges on the Reservation. These two interchanges, at 4th Street and 88th Street NE, experience congestion and cause mobility challenges for cars, trucks, pedestrians, and transit users. Frequently, traffic exiting I-5 to enter the Reservation or Marysville backs up onto the off-ramps and even onto traffic lanes on the I-5 mainline. These traffic impacts affect the Tribes and the City as well as the greater Snohomish County area, interstate travel and commerce, and even international trade with Canada. The configuration of the local road connections at the interchanges also impedes connections between the Tribes and the City for commuters, residents, visitors, freight, transit, and nonmotorized traffic. Backups cause lengthy delays at the signals crossing I-5 between these two communities, adversely affecting both commerce and emergency services.

The purpose of the I-5/4th Street and 88th Street Corridor Improvements Project is to support community and economic vitality by reducing congestion and improving mobility for cars, trucks, emergency services, pedestrians, and transit users traveling to, from, and across I-5 on 4th Street and 88th Street NE and within the Tribes' Reservation while enhancing safety and protecting the integrity of the interstate system.

The federal nexus for this project is necessary approvals by the Bureau of Indian Affairs (BIA) for expansion of existing road rights of way on tribal lands. This nexus triggers requirements for consultation with USFWS and NMFS under Section 7(c) of the ESA.

1.2 Project Location

The project involves improvements at the I-5 interchanges with 4th Street (exit 199) and 88th Street NE (exit 200). The project corridor straddles the boundary between the Tulalip Reservation and Marysville in Snohomish County, Washington (Figure 1). The project area lies within Water Resource Inventory Area (WRIA) 7 (Snohomish) and hydrologic units 171100110204 (Quilceda Creek) and 171100110203 (Frontal Possession Sound).

The project area is in Sections 20, 21, 28, 29, 32, and 33 of Township 30 North, Range 5 East, Willamette Meridian. The approximate latitude/longitude coordinates of the northern and southern project limits are 48.077° N/122.1848° W and 48.0480° N/122.1839° W, respectively.

1.3 Project Description

The project will include corridor improvements along 4th Street and 88th Street NE, as well as fish passage enhancements and stream habitat improvements at the 88th Street NE crossing of Coho Creek. Additional details about these project elements follow. See Appendix B for project design sheets that show areas of new and replaced impervious surfaces, conceptual plans for the new bridge and realigned stream channel at 88th Street NE, a conceptual layout for large woody material placement, and areas of anticipated impacts in and near Coho Creek.

Corridor improvements along 4th Street, from west to east, will include the following (Figure 2):

- Replacement of the signaled intersection of 4th Street and 33rd Avenue NE with a new roundabout
- Replacement of the signaled intersection of 4th Street and the I-5 southbound on-/off-ramps with a new roundabout
- Replacement of the signaled intersection of 4th Street and the I-5 northbound on-/off-ramps with a new roundabout
- Channelization improvements entering and exiting the roundabouts
- Reconfigured pedestrian and bicycle access along the alignment

Corridor Improvements along 88th Street NE, from west to east, will include the following (Figure 3):

- Replacement of the signaled intersection of 88th Street and 34th Avenue NE (Quil Ceda Blvd) with a new roundabout
- Replacement of the signaled intersection of 88th Street NE and the I-5 southbound on-/off-ramps with a new roundabout
- Replacement of the signaled intersection of 88th Street NE and the I-5 northbound on-/off-ramps with a new roundabout
- Replacement of the signaled intersection of 88th Street and 36th Avenue NE with a new roundabout
- Channelization improvements entering and exiting the roundabouts
- Reconfigured pedestrian and bicycle access along the alignment

Figure 1.
Vicinity Map

Snohomish County, WA

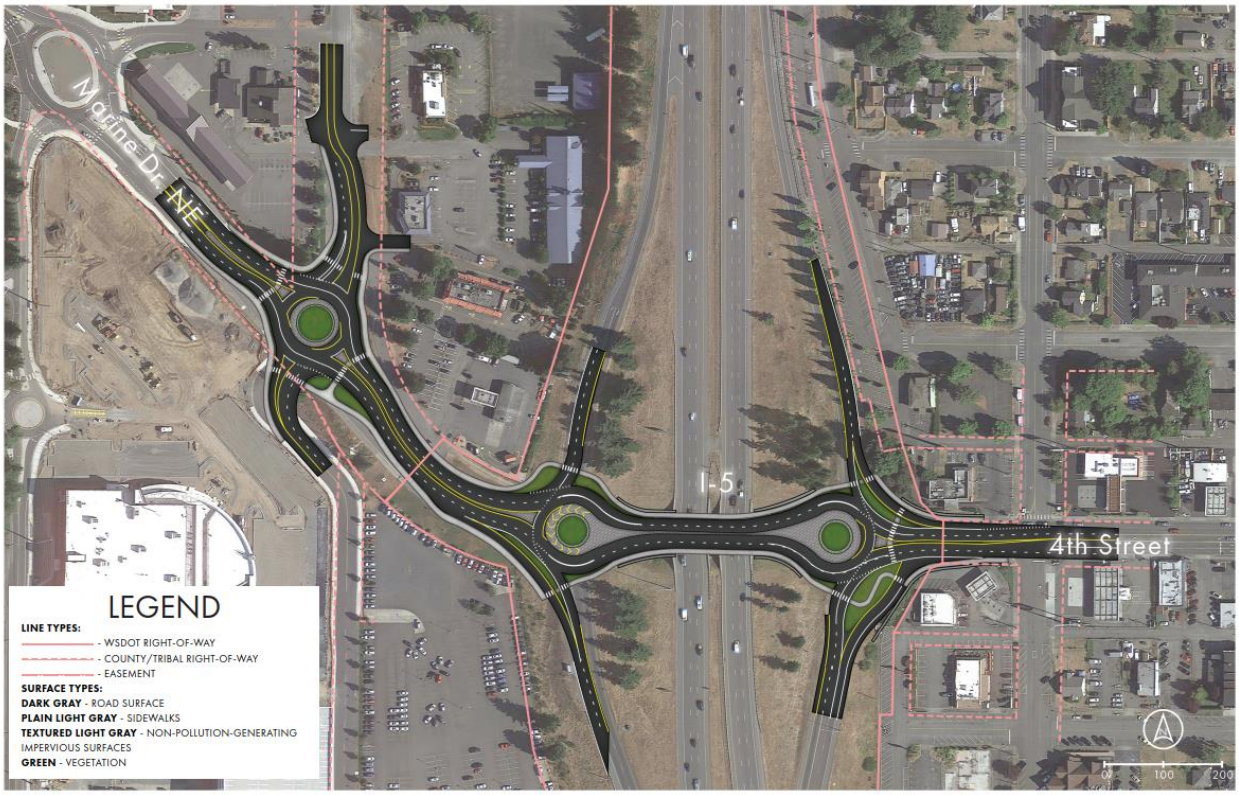

Figure 2. Proposed Improvements at 4th Street

Figure 3. Proposed Improvements at 88th Street NE

Approximately 750 feet west of the I-5 interchange, 88th Street NE crosses Coho Creek, a tributary to Quilceda Creek. Currently, the stream is conveyed under the roadway in an undersized, 54-inch-diameter concrete culvert. The project will replace the culvert and associated gabion-supported road fill prism with a 100-foot, single-span bridge. The new bridge will have a minimum hydraulic opening of 30 feet and a vertical clearance exceeding the desired wildlife clearance height of 8 feet.

To maintain traffic on 88th Street NE, bridge construction will occur in two stages. During the first stage, traffic will remain on the existing roadway while the first half the bridge is constructed. Traffic will then be shifted to the newly constructed portion of the bridge for the second stage while the remainder of the bridge is completed. The bridge structure will be supported on deep-drilled shafts. Mechanically stabilized earth walls will be constructed behind the bridge piers to support the roadway embankment. No impact or vibratory pile driving is anticipated. Roadway excavation will be limited to the amount necessary to provide sufficient clearance to construct the piers and place the bridge girders.

Once the bridge structure has been constructed, Coho Creek will be diverted into a new channel under the bridge. Flow will be introduced to the new channel gradually to minimize sediment delivery in downstream reaches. The remainder of the road fill will then be excavated, and the existing culvert will be removed. Utilities that are currently buried in the roadway will be attached to the underside of the new bridge, and a sanitary sewer line will be suspended between the bottom of the bridge structure and the creek.

The bridge will be designed consistent with criteria in WSDOT's Bridge Design Manual and WDFW's 2013 Water Crossing Design Guidelines. All construction activities within the ordinary high water line, including fish exclusion, will occur during the in-water work window established by the Tribes, which extends from July 15 through September 30.

The proposed stream alignment will move Coho Creek approximately 30 feet west of the existing culvert. Flows will be maintained in the existing channel and culvert while the new channel is being built. Under current conditions, as a result of backwater effects caused by the undersized culvert, the stream has a 90-degree turn and scour hole upstream of the road crossing. Approximately 90 linear feet of stream channel upstream of the new bridge will be realigned to provide a smooth bend at the road crossing. The new channel will tie back into the existing stream approximately 75 feet downstream of the new bridge to maintain the existing braided channel system. The new channel will match the hydraulic characteristics in the unaffected portions of the stream.

Design and implementation of the stream channel realignment will conform to the requirements set forth in WSDOT's 2019 Hydraulics Manual. The project will improve approximately 220 feet of the Coho Creek stream channel. Streambed substrates in the new channel will meet WSDOT standards for materials and size. Approximately 62 pieces of large woody material (including 20 key pieces), with a total wood volume of more than 85 cubic yards, will be placed in the stream.

Additional major items of work will include paving, grading, retaining walls, stormwater conveyance and treatment, sidewalks, lighting, utilities, turbid water management, temporary erosion control, clearing and grubbing, vegetation removal, vegetation management (e.g., planting native species in place of non-native species), pavement marking, traffic control, and signing. Bare soils will be revegetated and hydroseeded after construction. Suitable areas within wetland boundaries and wetland and stream buffers will be replanted with native species that support the ecological functions of those areas.

Work will take place primarily during daylight hours on weekdays. However, lane restriction requirements will necessitate nighttime operations for some activities, including excavation and haul

operations, setting girders, temporary soldier pile wall/shoring installation and removal, and temporary widening of existing roadways (if needed to minimize traffic impacts during construction).

Equipment required for project construction is expected to include the following:

- **General Roadway Construction Equipment**
  - Ground improvement equipment – cranes, loaders, dump trucks, and vibratory equipment
  - Heavy construction equipment – cranes, dozers, loaders, forklifts, excavators, graders, dump and haul trucks, air compressors, generators, and concrete trucks
  - Paving equipment – paving machines, rollers, and backhoes
  - Landscaping equipment – truck-mounted blowers and conveyors and hydro-seeding machines
- **Culvert Removal/Bridge Construction Equipment**
  - Bridge construction – drilled shaft equipment, such as oscillating drill rigs, cranes, and forklifts
  - Culvert removal – cranes, dozers, loaders, excavators, dump and haul trucks

1.3.1 Stormwater Management

The project is being designed in accordance with the following design guidance and criteria:

- WSDOT Highway Runoff Manual (M31-16.05), April 2019
- WSDOT Hydraulics Manual (M23-03.06), April 2019
- Washington State Department of Ecology (Ecology) Stormwater Management Manual for Western Washington, July 2019

A project-specific Stormwater Pollution Prevention Plan (SWPPP) and Temporary Erosion and Sediment Control (TESC) plan will be prepared and implemented before beginning earthwork under the project's National Pollutant Discharge Elimination System Construction Stormwater General Permit. It is anticipated that the sediment and flow-control BMPs described in the TESC and SWPPP will minimize the potential for water quality impacts to wetland and stream resources in the project area.

The project lies within nine threshold discharge areas (TDAs), based on downstream flow paths. The receiving waters are Ebey Slough, Quilceda Creek, and Coho Creek. Table 1 summarizes the current and anticipated post-construction acreage of impervious area and area directed to water quality treatment and/or infiltration facilities in each TDA.

The project will decrease the total area of pollution-generating impervious surfaces (PGIS) in all TDAs, combined, by approximately 0.24 acre, while the amount of runoff being treated and/or infiltrated will increase by nearly 6 acres (Table 1). New stormwater treatment facilities will provide enhanced treatment in all TDAs except TDA 2 and TDA 4; the level of treatment to be provided in those two TDAs is still under review.

For this analysis, it is assumed that runoff from the equivalent of 90 percent of all impervious surfaces (pollution-generating or non-pollution-generating) created or replaced in TDAs 1, 5, 6, 7, 8, and 9 will be routed to infiltration facilities. Construction work in TDA 2 will affect only a small amount of impervious surfaces and will result in a net reduction in impervious surface area; no modifications to existing drainage patterns or water quality treatment are proposed in this TDA. In TDAs 3 and 4, consistent with Highway Runoff Manual requirements, runoff from the equivalent of all new impervious surfaces will be treated. In

both TDAs, the increase in the amount of impervious area receiving stormwater treatment will be similar to the total increase in PGIS.

Table 1. Existing and Post-project Pollution-Generating Impervious Surface (PGIS) Area and Area Receiving Stormwater Treatment (Acres)

		Current		Proposed		Change	
TDA	Receiving Water	PGIS Area	Treated Area[1]	PGIS Area	Treated Area[2]	PGIS Area	Treated Area
1	Ebey Slough	2.55	0.00	2.27	1.89	- 0.28	+ 1.89
2	Quilceda Creek	0.59	0.00	0.50	0.00	- 0.09	0.00
3	Ebey Slough	3.29	0.00	3.72	0.41[3]	+ 0.43	+ 0.41
4	Ebey Slough	1.37	0.00	1.38	0.01[3]	+ 0.01	+ 0.01
5	Coho Creek	3.57	1.54	3.16	2.98	- 0.41	+ 1.44
6	Quilceda Creek	1.29	0.00	1.30	0.62	+ 0.01	+ 0.62
7	Quilceda Creek	1.61	0.62	1.71	1.93	+ 0.10	+ 1.31
8	Quilceda Creek	1.71	1.28	1.67	1.43	- 0.04	+ 0.15
9	Quilceda Creek	0.15	0.13	0.18	0.20	+ 0.03	+ 0.07
	TOTALS	***16.13***	***3.57***	***15.89***	***9.47***	***- 0.24***	***+ 5.90***

[1] Under current conditions, "Treated Area" consists of areas directed to water quality treatment facilities.
[2] Under proposed conditions, "Treated Area" includes areas directed to existing treatment facilities, along with new or replaced impervious surfaces from which runoff will be treated or infiltrated.
[3] Runoff from TDAs 3 and 4 will be directed to treatment facilities where infiltration is not expected to occur.

New stormwater treatment facilities in TDAs 1, 5, 6, 7, 8, and 9 will be designed to accommodate runoff from new and replaced impervious surfaces during a 100-year storm event. Although a direct comparison is not possible at this time, this design standard is likely comparable to treating the volume of water equal to 50 percent of the cumulative rainfall from existing, new, and replaced impervious surfaces during a 2-year, 24-hour storm. Infiltration BMPs built to meet minimum flow control requirements in TDAs 1, 5, 6, 7, 8, and 9 will further reduce the amount of untreated stormwater that reaches surface waters. In most TDAs, treated stormwater that cannot be infiltrated will be directed to existing outfalls for stormwater facilities. The exception is TDA 5, where runoff currently enters Coho Creek through multiple, uncontrolled pathways; a new outfall, with scour protection, will be established for runoff from project-created or -replaced impervious surfaces in that TDA.

Following are brief overviews of the nine TDAs. The overviews identify the catchment area, existing conveyance network, and receiving water for each one. The locations of the TDAs are shown in Figure 4 on page 12 of this document.

TDA 1 drains the western portion of the project area near the I-5/4th Street interchange. Runoff is conveyed south through a system of pipes along 33rd Ave NE, outfalling to a wetland just south of 60th Pl NE, approximately 1,200 feet from Ebey Slough. The project will provide enhanced treatment for runoff from this TDA, via a bioretention facility, an infiltration trench or gallery, or a proprietary BMP.

TDA 2 drains a small area in the northwestern the project area near the 4th Street interchange. Runoff is conveyed north and west in pipes and ditches, outfalling to Quilceda Creek near Marine Drive, approximately 1.25 miles upstream of the stream's confluence with Ebey Slough. Based on the small area of new impervious surface being created in this TDA, it is exempt from runoff treatment and flow control requirements, per the Highway Runoff Manual. Analyses in this document are based on the assumption that no water quality treatment will be provided for runoff from this TDA. It is possible, however, that a portion of the existing ditch conveyance system may be converted to a treatment swale that would provide either basic or enhanced treatment.

TDA 3 drains 4th Street at the I-5 interchange, including on- and off-ramps. Runoff is conveyed south in pipes that discharge to Ebey Slough immediately west of I-5, near Log Dump Road/60th Place NE. Due to the proximity of runoff to Ebey Slough, this TDA is exempt from flow control requirements per the Highway Runoff Manual. However, runoff from an area equivalent to the area of all new impervious surfaces (pollution-generating and non-pollution-generating) will be directed to a stormwater treatment facility. Based on the limited amount of space available, it is likely that this will be a proprietary BMP that does not allow for substantial infiltration but that provides enhanced treatment.

TDA 4 drains 4th Street east of the I-5 interchange. Runoff is conveyed via pipes to the site of the former Geddes Marina boat basin adjacent to Ebey Slough. The City is developing a regional stormwater treatment facility on this site; the new regional facility is expected to be complete before this project is built. The proposed facility will treat stormwater runoff from existing impervious surfaces in an approximately 480-acre area that drains to Ebey Slough. Because TDA 4 lies entirely within the drainage basin being treated by the regional stormwater facility, the project will not have to provide treatment from runoff from existing or replaced impervious surfaces in TDA 4. As with TDA 2, TDA 4 is exempt from Runoff Manual-based runoff treatment and flow control requirements because of the small area of new impervious surface. Analyses in this document are based on the assumption that no water quality treatment will be provided for runoff from this TDA. The need for treatment prior to discharge to the regional facility is under review.

TDA 5 drains 88th Street NE, Quil Ceda Blvd, and part of the southbound on- and off-ramps west of the I-5/88th Street NE interchange. Runoff is conveyed to Wetland A adjacent to the project site via pipes and ditches. Currently, runoff outfalls to the wetland at several locations at or a few feet above the ordinary high water line. Under current conditions, runoff from some impervious surfaces in this TDA is directed to a bioswale; runoff from some additional areas passes through oil/grit separators. The project will provide enhanced treatment for runoff from this TDA, via a bioretention facility, an infiltration trench or gallery, a proprietary BMP, and/or a bioswale.

TDA 6 drains the west side of the 88th Street NE bridge where it crosses over I-5, along with a portion of the southbound on- and off-ramps west of the interchange. Runoff is conveyed south along the west side of I-5, primarily in ditches, outfalling to Quilceda Creek approximately 3,000 feet south of the project area, immediately downstream of the I-5 bridge over the stream. Much of the runoff from this TDA infiltrates in the conveyance ditches and never enters Quilceda Creek. The project will provide enhanced treatment for runoff from this TDA, via a bioretention facility or a bioswale.

TDA 7 drains the east side of the 88th Street NE bridge where it crosses over I-5, along with the northbound on- and off-ramps east of the interchange. This TDA also includes a small area south of 88th Street NE east of the I-5 interchange, as well as a portion of a private parcel from which runoff receives partial treatment in a bioswale before joining the TDA's conveyance system. Runoff is conveyed south in ditches along the east side of I-5, outfalling to a wetland adjacent to Quilceda Creek approximately 2,500 feet south of the project area. As with TDA 6, much of the runoff from this TDA

infiltrates in the conveyance ditches and never enters Quilceda Creek. The project will provide enhanced treatment for runoff from this TDA, via a bioretention facility, an infiltration trench or gallery, and/or a bioswale.

TDA 8 drains the north side of 88th Street NE east of the I-5 interchange. Runoff is conveyed via pipes to a stormwater treatment pond that is assumed to outfall to Quilceda Creek north of 88th Street NE. City staff have expressed concern that the capacity of this pond may be exceeded during major storm events, spilling untreated stormwater to the stream. The project will provide enhanced treatment for runoff from this TDA, via an infiltration trench or gallery and/or a proprietary BMP.

TDA 9 drains a very small area south of 88th Street NE, east of 36th Ave NE. This TDA does not appear to connect to any public systems, but runoff from part of the TDA flows to a bioswale on private property. Runoff from the TDA is presumed to discharge to Quilceda Creek. The project will provide enhanced treatment for runoff from this TDA, via a proprietary BMP.

1.3.2 Interrelated and Interdependent Activities

An interrelated activity is part of the proposed action and depends on the proposed action for its justification. An interdependent activity has no independent utility apart from the action under consultation.

Activities associated with mitigation for impacts to streams, wetlands, and wetland buffers can be considered interrelated and interdependent actions for this project. The need for mitigation for such impacts is yet to be determined. If mitigation is required, options may include on-site restoration or enhancement or identification of a suitable site for in-kind mitigation nearby. Impacts to wetlands, streams, and their regulatory buffers will be mitigated in accordance with applicable tribal, federal, state, and local requirements. If mitigation for project-related impacts to wetlands and wetland buffers may result in impacts to ESA-listed species and habitats not considered in this analysis, those impacts will be addressed through future consultation.

Detour routes are a potentially interrelated activity, but they are not expected to be required for the project, although closures of I-5 on- and off-ramps may affect travel patterns. They would be short-term (weekend) closures. No long-term closures are anticipated.

1.3.3 Project Sequencing and Timeline

Project construction is expected to require a minimum of two (2) years, with an anticipated construction start in Spring 2024. It is anticipated that construction at the interchanges for both 4th Street and 88th Street NE will be occurring at the same time. It is anticipated that one-half of each roadway will be under construction at a time, keeping traffic flow continuous throughout construction, but with potential temporary reduction in lanes. Bridge construction at the Coho Creek crossing will also be performed in stages, allowing traffic on 88th Street NE to be maintained during construction. As noted above, all construction activities below the ordinary high water line will occur during the in-water work window established by the Tribes (July 15 through September 30).

1.4 Performance Standards and Impact Avoidance, Minimization, and Mitigation Measures

Conservation measures and best management practices (BMPs) have been incorporated into the proposed project to avoid and minimize short-term and long-term impacts to ESA listed fish and wildlife species

and their habitats in the project vicinity. Significant short-term effects on water quality are not expected if erosion control and spill containment BMPs are properly implemented, monitored, and maintained during construction. A TESC plan will be prepared and implemented to minimize sedimentation into Coho Creek and to minimize erosion to surrounding areas.

Following are BMPs and conservation measures that will be incorporated into the design and implementation of the project, to avoid and minimize impacts to the species and critical habitats addressed in this BA.

Erosion and Sediment Control

- Implement construction phasing that minimizes the amount of earthwork that exposes the ground surface to erosion.
- Implement a TESC plan, including sediment-control BMPs such as silt fences, check dams, sediment traps, sedimentation basins, and flocculation methods.
- Use erosion-control practices (seeding, mulching, soil conditioning with polymers, use of geo synthetics, sod stabilization, erosion-control blankets, vegetative buffer strips, and preservation of trees with construction fences).
- Use construction entrances, exits, and parking areas that reduce sediment tracking onto public roads.
- Perform routine inspections of erosion-control and sediment-control BMPs and subsequent BMP maintenance.
- Erosion of stockpiled materials will be controlled per City of Marysville Engineering Drainage and Erosion Control Design Standards (City of Marysville 2016).

In-Water Work

- In-water work will occur only within the in-water work window (July 15 to September 30) as specified by Tulalip tribal biologists (Nelson, personal communication, 2021).
- Fish exclusion work will follow the guidance outlined within the Recommended Fish Exclusion, Capture, Handling, and Electroshocking Protocols and Standards document (USFWS 2012).
- Flow will be introduced to the new channel gradually to minimize sediment delivery in downstream reaches.
- Biologists will perform pre-construction surveys for Oregon spotted frog egg masses. Surveys will be performed in spring in potentially suitable habitat associated with Coho Creek near the 88th Street NE bridge construction site. If Oregon spotted frog egg masses are discovered, BIA and WSDOT will coordinate with USFWS on implementation of additional conservation measures.

Clearing and Vegetation Removal

- High-visibility construction fencing will be installed around the work area to protect sensitive areas such as wetlands and streams from construction-related impacts.
- Exposed slopes and disturbed areas around the construction area will be replanted.
- Wetlands, wetland buffers, and stream buffers temporarily affected by construction activities will be restored in accordance with Tulalip Tribes regulations and guidance from Tribal Natural Resources staff.

Stormwater Pollution/Spill Prevention

- A spill prevention, control, and countermeasures (SPCC) plan will be implemented. Elements of this plan will satisfy all pertinent requirements set forth by tribal, federal, state, and local laws and regulations.
- All construction vehicles operated within 150 feet of any stream or waterbody will be inspected daily for fluid leaks before leaving the vehicle staging area. Any leaks detected will be repaired before the vehicle resumes operation. When not in use, all vehicles will be stored in designated staging areas outside of wetlands, streams, and associated buffers. Other vehicles that may be stored in place will be inspected daily for fluid leaks.
- Staging areas will be located in areas that will prevent the potential for contamination of any wetland or water body.
- All mechanical equipment will be fueled and serviced at least 150 feet from surface-flowing streams.
- Spill response equipment will be kept on-site for potential fluid leakage.
- Additionally, drip pans will be fitted with absorbent pads and placed under all equipment being fueled.

Construction Activities

- Concrete truck chute cleanout areas will be established to properly contain wet concrete and wash water and to prevent it from entering wetlands and other waterbodies.
- All concrete will be poured in the dry (or within confined waters not being dewatered to surface waters) and will be allowed to cure a minimum of 7 days before contact with surface water.

Lighting

- No permanent lighting will be directed downward toward fish-bearing waters.
- Temporary lights for night work will be directed away from waters with listed fish species to the greatest extent possible, with the intent to prevent light from shining on surface waters.

1.5 Action Area

In this document, the term *action area* has a specific meaning, defined below. The action area is different from the *project site* (which encompasses the limits of construction and which is also referred to as the project footprint) and from the *project area* (a more general term for the vicinity of the project site).

The action area is defined as the area that may be affected directly or indirectly by the project action. For this assessment, the action area includes the project footprint, terrestrial areas where construction noise will be audible, aquatic areas where the project may result in short-term or long-term impacts on water quality, and aquatic habitats to which fish access will be improved through the replacement of the Coho Creek culvert with a new bridge (Figure 4). The action area also includes areas where project construction may influence the conversion of currently undeveloped or underdeveloped parcels to a more developed state.

The project footprint includes the portions of 4th Street, 88th Street NE, and associated I-5 on- and off-ramps where corridor improvements will be implemented, as well as the areas that will be disturbed for bridge construction and culvert removal. Additional wetland buffer off-site mitigation may be required for the project, but this has not yet been identified. The buffer mitigation would likely be located within the Coho Creek complex north of the 88th Street NE.

Action Area
I-5/4th and 88th Street NE
Corridor Improvements
Snohomish County, WA

The distance at which construction noise will be audible is based on the distance at which noise will attenuate to background levels. That distance depends on (1) the sound intensity level of the equipment being used, (2) the background noise levels, and (3) the capacity of the landscape to absorb sound energy (noise attenuates more rapidly in forested areas, compared to hard landscapes such as parking lots, for example). Based on these considerations, the terrestrial portion of the action area encompasses the following areas, based on the distance at which construction noise is expected to be audible:

- Areas approximately 2,300 feet in all directions from the 4th Street interchange
- Areas approximately 2,300 feet east from the 88th Street NE interchange
- Areas approximately 1,900 feet west from the 88th Street NE interchange

The aquatic portion of the action area includes the following portions of Ebey Slough, Quilceda Creek, and Coho Creek:

- Areas of Ebey Slough immediately adjacent to the outfalls from stormwater facilities that receive and treat runoff from the project site
- The main stem of Quilceda Creek, extending upstream from Ebey Slough to the outfalls from stormwater facilities that receive and treat runoff from the project site
- Coho Creek, including aquatic habitats upstream of the 88th Street NE crossing

The extent of the action area in Ebey Slough and in the two streams downstream of the stormwater facility outfalls reflects the area in which contaminants in stormwater runoff may be expected to exceed background levels. The volume of water in Ebey Slough will dilute contaminants in stormwater to negligible levels almost immediately after the treated stormwater enters the slough. Contaminant concentrations in the streams are expected to be diluted to negligible levels a short distance downstream of the stream's confluence with a larger water body. For Quilceda Creek, this is the stream's mouth in Ebey Slough; for Coho Creek, this is the stream's confluence with Quilceda Creek.

The extent of the action area in Coho Creek upstream of the 88th Street NE crossing consists of the aquatic habitats to which fish access will be improved through the replacement of the Coho Creek culvert with a new bridge.

The action area in Coho Creek also encompasses the area where in-stream work will occur for stream realignment, as well as the area that could be exposed to elevated sediment and turbidity levels during construction. Given that work over and near the stream will be performed during the period when stream flows are lowest, and based on anticipated stream flows between 10 and 100 cubic feet per second, any elevated turbidity resulting from an unanticipated release of sediment to Coho Creek would not be detectable more than 200 feet downstream of the project limits. This distance represents the maximum anticipated extent of any sediment plumes that may be generated by work over or near the stream. Any effects resulting from clearing of riparian vegetation will also be limited to this area.

In addition to the areas described above, the action area includes all parcels within 0.25 mile of the project footprint. As such, it encompasses the areas where project construction could reasonably be expected to influence the conversion of currently undeveloped or underdeveloped parcels to a more developed state. The project is not dependent on any land-use development or changes in land use or zoning, and no land-use development projects depend directly on completion of this project.

2. Status and Presence of Listed Species and Designated Critical Habitat in the Project Action Area

Biologists consulted the following resources to develop and refine the list of species that might be affected by the proposed project:

- The USFWS Information for Planning and Consultation (IPaC) website (USFWS 2021a; see Appendix C)
- The WDFW SalmonScape mapping system (WDFW 2021a)
- The Northwest Indian Fisheries Commission Statewide Integrated Fish Distribution webmap (NWIFC 2022).
- Maps depicting the distribution of ESA-listed Pacific salmon and steelhead under the jurisdiction of NMFS)
- WDFW Priority Habitats and Species data (WDFW 2021b)
- USFWS critical habitat online mapper (2021b)
- Bird species maps and sighting data (eBird 2021)
- Washington Department of Natural Resources (WDNR) Washington Natural Heritage Program data (WDNR 2021)
- Tulalip Tribes natural resources GIS mapping
- The Quil Ceda Village Compensation Planning Framework for the Quilceda watershed (Quil Ceda Village 2009).

2.1 Species and Critical Habitat Lists and Listing Status

USFWS and NMFS indicate that the project will occur within the general range of the ESA-listed species and designated critical habitat shown in Table 2 on the next page. No species proposed for listing have been observed or are expected to use habitats in the action area, and no areas proposed for designation as critical habitat are present.

The IPaC list for the project does not identify the gray wolf as an ESA-listed species potentially present in the action area (Appendix C). This may be a product of the rule issued by USFWS on November 3, 2020 (85 Federal Register [FR] 69778), removing gray wolves from the list of species protected under the ESA. However, on February 10, 2022, the U.S. District Court for the Northern District of California vacated and remanded USFWS' delisting rule. The court's decision effectively reinstated the listing status the species had before USFWS issued the delisting rule. As a result, gray wolves in western Washington have a listing status of endangered.

Table 2. ESA-listed Species and Critical Habitat Considered for This BA

Species	Status	Federal Jurisdiction	Critical Habitat in Action Area
Chinook salmon (*Oncorhynchus tshawytscha*) (Puget Sound ESU)	Threatened	NMFS	Yes
Steelhead (*Oncorhynchus mykiss*) (Puget Sound DPS)	Threatened	NMFS	Yes
Bull trout (*Salvelinus confluentus*)	Threatened	USFWS	Yes
Southern Resident killer whale (*Orcinus orca*)	Endangered	NMFS	No
Marbled murrelet (*Brachyramphus marmoratus*)	Threatened	USFWS	No
Streaked horned lark (*Eremophila alpestris strigata*)	Threatened	USFWS	No
Yellow-billed cuckoo (*Coccyzus americanus*)	Threatened	USFWS	No
Oregon spotted frog (*Rana pretiosa*)	Threatened	USFWS	No
Gray wolf (*Canis lupus*)	Endangered	USFWS	No

Three of the species identified in Table 2 are not expected to occur in the action area for the following reasons:

- **Streaked horned larks** are not expected to use habitats in the action area. This species is known to occur in portions of southern Puget Sound, along the Washington Coast, and at lower Columbia River islands (78 FR 61451, October 3, 2013). Breeding habitat for streaked horned larks in Washington consists of grasslands and sparsely vegetated areas at airports, sandy islands, and coastal spits. No such habitat is present in the action area. The nearest known breeding area is more than 60 miles from the action area. The nearest location where critical habitat has been designated for the streaked horned lark is more than 100 miles from the action area.
- **Yellow-billed cuckoos** nest almost exclusively in low- to mid-elevation riparian woodlands that cover 50 acres or more within arid to semiarid landscapes (Hughes 1999). Most breeding sites have been found in patches larger than 200 acres. Historical records indicate that breeding habitat for yellow-billed cuckoos in Washington consisted primarily of cottonwood and willow bottoms along the lower Columbia River and in the Puget Sound lowlands. The last confirmed breeding records of yellow-billed cuckoos in Washington are from the 1930s. Currently, the species no longer breeds in western Canada and the northwestern continental United States (Washington, Oregon, and Montana) (79 FR 59991, October 3, 2014). No observations of this species have been documented within 10 miles of the action area (WDFW 2021a; eBird 2021). No blocks of suitable forested riparian habitat larger than 5 acres are present in the action area.

- **Gray wolves** require areas with abundant prey and low levels of human disturbance. Based on the location of the project area in a lowland urban setting with high levels of human activity and no nearby roadless areas, no suitable habitat for this species is present in the action area.

Based on the above, the project has no potential to affect streaked horned larks, yellow-billed cuckoos, or gray wolves. Therefore, these species will not be addressed further in this analysis.

Information from the Washington Department of Natural Resources (WDNR) Natural Heritage database indicates that no ESA-listed plant species are known to occur within several miles of the project area (WDNR 2021).

The following section provides information about the status of Puget Sound Chinook salmon, Puget Sound steelhead, bull trout, Oregon spotted frog, marbled murrelet, and southern resident killer whale), as well as the timing and nature of their habitat use in the action area. Information about critical habitat in the action area is presented in Section 2.3.

2.2 Presence of Federally Listed and Proposed Species in the Project Action Area

Biologists from the Tulalip Tribes and Parametrix have conducted field investigations in the action area on several occasions, summarized below. Before conducting fieldwork, the biologists reviewed maps and materials on the soils, hydrology, topography, land use, floodplains, wetlands, streams, and wildlife habitat in the action area.

2.2.1 Marbled Murrelet

USFWS listed marbled murrelets as threatened under the ESA in 1992 due to a decline in abundance and habitat degradation in the southern portion of their range (57 FR 45328, October 1, 1992). Marbled murrelets nest in mature and old-growth conifer-dominated forest, and they forage in nearshore marine waters. Marbled murrelet population declines have been attributed primarily to the loss and fragmentation of old-growth nesting habitat caused by logging and development (Ralph and Miller 1995). In addition, this species is vulnerable to fishing nets and oil spills (Marshall 1988).

WDFW (2021b) does not report any observations of marbled murrelets in the action area. The closest suitable nesting habitat is located 15 miles east of the action area in the Cascade Mountains of eastern Snohomish County. The terrestrial portion of the action area (i.e., the area in which construction noise will be audible) overlaps some nearshore marine habitats in Ebey Slough. Additionally, outfalls from stormwater facilities associated with the project discharge into nearshore marine habitats. Therefore, the action area includes some potential foraging habitat.

A 10-acre stand of mature conifer trees (older than 70 years) is adjacent to Coho Creek and directly south of 88th Street NE. A biologist searched portions of the stand for potential nest platforms and found none. It is impossible to state with certainty that no platforms are present within that stand. The probability is low, however. Habitat modeling performed for the 20-year review of the Northwest Forest Plan classified the stand as marginal habitat. Stands classified as marginal are considered unsuitable habitat for old-growth-associated species such as marbled murrelets (Davis et al. 2011). All forested areas near the project site have been logged multiple times in the past century and a half. Furthermore, the stand is dense, isolated, and surrounded by residential and commercial uses.

2.2.2 Puget Sound Chinook Salmon

Chinook salmon in the Puget Sound evolutionarily significant unit (ESU) are listed as threatened under the ESA (64 FR 14308, March 24, 1999). The ESU includes naturally spawned Chinook salmon originating from rivers flowing into Puget Sound, along with Chinook salmon from 26 artificial propagation programs. Primary factors contributing to declines in Chinook salmon in the Puget Sound ESU include habitat blockages, genetic modification of wild fish through interbreeding with hatchery fish, urbanization, logging, hydropower development, harvests, and flood control and flood effects (NMFS 1998).

The action area includes portions of three streams where Chinook salmon may be present. Stormwater detention and treatment facilities will discharge to Ebey Slough (an estuarine waterway at the mouth of the Snohomish River) via two existing outfalls. Quilceda Creek, a tributary to Ebey Slough, will also receive treated and untreated stormwater runoff from the project site (TDAs 2, 6, 7, 8, and 9). Finally, project construction will entail ground-disturbing work in Coho Creek, a tributary to Quilceda Creek. In addition, one outfall for stormwater from TDA 5 discharges to Coho Creek directly upstream of the 88th Street NE crossing.

The Snohomish River basin supports both summer-run and fall-run Chinook stocks, which enter the system between June and September and then spawn from early fall through late November (Northwest Indian Fisheries Commission [NWIFC] 2022; WDFW 2021a; Haring 2002). Adult summer-run and fall-run Chinook are expected to be in Ebey Slough from June to September, migrating through the estuary on their way to spawning habitat in the Snohomish River system. Juvenile Chinook salmon have been captured in Ebey Slough during all months (Rice et al. 2014). Densities are highest during May and June, corresponding to the peak of the estuary residence time for juvenile Chinook from the Snohomish River system (Rice et al. 2014; Haring 2002). During beach seine surveys conducted in the Snohomish River estuary in 2013, Rice et al. (2014) found juvenile Chinook salmon at densities of 700 to 900 fish per hectare during May and June. Densities fell off rapidly in August (approximately 200 fish per hectare) and September (less than 100 fish per hectare) and began increasing again in March (approximately 160 fish per hectare) and April (approximately 240 fish per hectare).

According to NWIFC (2022), summer-run Chinook salmon have been documented in Quilceda Creek, and fall-run Chinook spawn in Quilceda Creek. Chinook use of Quilceda Creek is characterized as "relatively minimal," compared to Chinook use of the Snohomish River system (Quil Ceda Village 2009). This is likely attributable to the limited availability of suitable spawning substrates in the Quilceda Creek watershed. Only a few spawning areas have been identified along the main stem of Quilceda Creek, approximately 3 miles upstream from the action area (NWIFC 2022). Juvenile Chinook salmon from the Quilceda Creek system are predominantly ocean-type—that is, they migrate downstream from April to early June and are largely absent from fresh waters by mid-July (Quil Ceda Village 2009).

Neither NWIFC (2022) nor WDFW (2021a, b) reports the documented or expected presence of Chinook salmon in Coho Creek. The stream is characterized as gradient-accessible, meaning no natural barriers preclude access to habitats in the action area. However, low flows, high water temperatures, and a preponderance of fine sediments render the stream unsuitable for spawning (Nelson, personal communication, 2022a). It is possible that rearing juveniles may enter Coho Creek, although no Chinook salmon were documented at the smolt trap that was in place between 2002 and 2011 at 27th Ave NE, approximately 0.4 mile upstream of 88th Street NE (Tulalip Tribes Environmental Department [TTED] 2012). Juvenile and adult Chinook salmon are unlikely to be present in Coho Creek during the in-water work window (Nelson, personal communication, 2022a).

2.2.3 Puget Sound Steelhead

The Puget Sound steelhead distinct population segment (DPS) is listed as a threatened species (72 FR 26722, May 11, 2007). The DPS includes all naturally spawned anadromous steelhead originating below natural and manmade impassable barriers from rivers flowing into Puget Sound (79 FR 20802, April 14, 2014). The DPS also includes steelhead from six artificial propagation programs.

As described above for Chinook salmon, the action area includes portions of three streams where steelhead may be present. The presence of steelhead in these streams is described below.

The Snohomish River basin supports both summer-run and winter-run steelhead (NWIFC 2022; WDFW 2021a). Summer-run steelhead pass through the lower estuary, including Ebey Slough, and return to freshwater systems between May and October (Haring 2002). Winter-run steelhead pass through the lower estuary and return to freshwater systems between November and April. For both runs, spawning takes place in freshwater habitats from January through June (Haring 2002). Steelhead smolts, because of their larger size and age compared to other species of outmigrating juvenile salmonids, typically do not linger in the estuarine environment before moving into the marine environment. Limited numbers of steelhead smolts have been sampled in estuary marshes, including Ebey Slough, primarily from mid-April though early July, although some steelhead smolts have been sampled through August (Pentec 1992).

According to NWIFC (2022), summer-run steelhead have been documented in Quilceda Creek, and juvenile winter-run steelhead rear in Quilceda Creek. Summer-run steelhead are typically found only where habitat is not fully utilized by winter-run populations; therefore, it is unlikely that many summer-run steelhead are present in Quilceda Creek (Quil Ceda Village 2009). Spawning activity within Quilceda Creek is limited to small areas with suitable substrate. Based on the preponderance of fine sediments, reaches of Quilceda Creek in the action area are extremely unlikely to support steelhead spawning (Nelson, personal communication, 2022b). Based on the freshwater residence time of juvenile steelhead (typically 2 to 3 years), rearing juveniles that originate from spawning grounds farther upstream in the system may be present in the action area at any time of year.

Neither NWIFC (2022) nor WDFW (2021a, b) reports the documented or expected presence of steelhead in Coho Creek. The stream is characterized as gradient-accessible, meaning no natural barriers preclude access to habitats in the action area. However, low flows, high water temperatures, and a preponderance of fine sediments render the stream unsuitable for spawning (Nelson, personal communication, 2022a). It is possible that rearing juveniles may enter Coho Creek, although no steelhead were documented at the smolt trap that was in place between 2002 and 2011 at 27th Ave NE, approximately 0.4 mile upstream of 88th Street NE (TTED 2012). Juvenile and adult steelhead are unlikely to be present in Coho Creek during the in-water work window (Nelson, personal communication, 2022a).

2.2.4 Bull Trout

USFWS listed bull trout as threatened under the ESA on November 1, 1999 (64 FR 58910). Similarly, USFWS proposed Dolly Varden (*Salvelinus malma*) for listing as endangered on January 9, 2001 (66 FR 1628) due to similarity of appearance with bull trout and because they overlap with bull trout in the coastal and Puget Sound region. A designation of threatened or endangered under the similarity of appearance provisions of the ESA extends the take prohibitions of Section 9 to cover the species. However, under section 4(e) of the ESA, a designation of threatened or endangered due to similarity of appearance does not extend other protections of the ESA, such as the consultation requirements for federal agencies under Section 7. Although not formally discussed in this document, the effects of the action on Dolly Varden are anticipated to be similar to those discussed for bull trout.

As described above for Chinook salmon, the action area includes portions of three streams where bull trout may be present. The presence of bull trout in these streams is described below.

The Snohomish River supports one of eight core populations of bull trout in the Puget Sound Management Unit (USFWS 2004). Fluvial and anadromous bull trout adults, sub-adults, and juveniles use habitats in estuarine habitats near the river's mouth, including Ebey Slough, primarily during spring and summer. Goetz et al. (2021) found the residence time of bull trout in marine waters to be fairly brief; most bull trout adults and subadults entered marine waters from April to June and migrated back into rivers by July and August as temperatures rose. Bull trout were not detected in the Snohomish River delta from October through December (Goetz et al. 2021) Spawning adults head upstream to headwater tributaries; anadromous subadults overwinter in the mainstem Snohomish River, generally upstream of the head of Ebey Slough, outside the action area (USFWS 2004; Goetz 2016; Pentec 2002; Snohomish Basin Salmon Recovery Forum 2005). Juvenile bull trout move through the estuary as they migrate out of the Snohomish River system during spring and summer (primarily mid-April through mid-July) (Goetz et al. 2004).

According to NWIFC (2022), bull trout may rear in the main stem of Quilceda Creek in the action area. On the other hand, USFWS found no clear documentation of bull trout us in this system, although they acknowledged the possibility that bull trout may enter the stream on occasion to forage (70 FR 56211, September 26, 2005). Based on the stream's distance from known spawning areas, elevated water temperatures in the stream, and the lack of suitable substrates, bull trout are not expected to spawn in the Quilceda Creek system. WDFW (1999) determined that successful spawning by bull trout occurs only upstream of the winter snow line (i.e., the elevation at which snow is present on the ground for much of the winter); no portions of the Quilceda Creek watershed are upstream of this line. If any bull trout are present in Quilceda Creek, they would likely be rearing juveniles or overwintering adults or subadults (Quil Ceda Village 2009; Marks, personal communication, 2021).

Neither NWIFC (2022) nor WDFW (2021a, b) reports the documented or expected presence of bull trout in Coho Creek. The stream is characterized as gradient-accessible, meaning no natural barriers preclude access to habitats in the action area. However, low flows, high water temperatures, and a preponderance of fine sediments render the stream unsuitable for spawning (Nelson, personal communication, 2022a). In addition, as noted above, bull trout are not expected to spawn in the Quilceda Creek system. It is possible that adults or subadults may enter Coho Creek to forage, although no bull trout were documented at the smolt trap located on 27th Ave NE (TTED 2012). Bull trout are unlikely to be present in Coho Creek during the in-water work window (Nelson, personal communication, 2022a).

2.2.5 Oregon Spotted Frog

USFWS listed Oregon spotted frogs as threatened under the ESA on August 29, 2014 (79 FR 51658). Oregon spotted frogs are associated with large, emergent freshwater wetlands, typically larger than 10 acres (Pearl and Hayes 2004). Breeding occurs in February or March at lower elevations. Females deposit egg masses in shallow, often temporary, pools generally no more than 6 inches deep. Eggs usually hatch within 3 weeks, and the tadpoles metamorphose into froglets during their first summer (Leonard et al. 1993).

The closest known extant population of Oregon spotted frogs is along the Samish River in Skagit and Whatcom Counties, approximately 30 miles north of the action area. In addition, Tulalip tribal biologists have conducted field work in wetlands throughout the watershed, but they have not observed any Oregon spotted frogs during that work (Warner, personal communication, 2022; Nelson, personal communication, 2022a). Nevertheless, guidance developed by WSDOT (2015) indicates that potentially suitable habitats

in the Quilceda Creek-Frontal Possession Sound watershed have the potential to support populations of Oregon spotted frogs.

The Coho Creek wetland complex near the 88th Street NE crossing contains potentially suitable breeding, rearing, and overwintering habitat for Oregon spotted frogs (Appendix D). Habitat features that provide potentially suitable habitat for breeding and rearing include inundation for at least 4 months per year, shallow water areas (less than 12 inches deep) with sun exposure, gradual topographic gradient from shallow water toward deeper, permanent water, and predominantly herbaceous wetland vegetation (WSDOT 2015). Given the proximity of forest cover and the predominance of dense, monocultural stands of reed canarygrass, habitats near the project site are unlikely to provide suitable oviposition sites for Oregon spotted frogs. Inundation of the Coho Creek wetland complex between October and March indicates the presence of potentially suitable overwintering habitat (WSDOT 2015).

2.2.6 Southern Resident Killer Whale

The southern resident DPS of killer whales was listed as endangered on February 16, 2006 (70 FR 69903), and a recovery plan was completed in 2008. In 2016, NMFS completed a 5-year review and concluded that southern resident killer whales (SRKWs) should remain listed as endangered (NMFS 2021).

The recovery plan identified several factors that may be limiting SRKW recovery. These include quantity and quality of prey, toxic chemicals that accumulate in top predators, and disturbance from sound and vessels (NMFS 2008). Oil spills are also a risk factor. It is likely that multiple threats are acting together to impact the whales. Although it is not clear which threat or threats are most significant to the survival and recovery of SRKWs, all the threats identified are potential limiting factors in the population dynamics of the DPS (NMFS 2008).

Chinook salmon make up a significant proportion of SRKW diets. Estimates range from approximately 70 percent during winter and spring to more than 90 percent during summer and fall (NMFS 2021).

Aquatic habitats in the action area consist of shallow, confined, estuarine areas that SRKWs are not expected to enter. There have been no documented observations of SRKWs in the action area. For these reasons, the project has no potential to directly affect SRKWs or their habitat. However, based on the potential for adverse impacts on Chinook salmon—a primary prey species for SRKWs—analyses in this BA consider potential indirect impacts on this species.

2.3 Presence of Federally Designated or Proposed Critical Habitat in the Project Action Area

2.3.1 Puget Sound Chinook Salmon Critical Habitat

Portions of Ebey Slough and Quilceda Creek in the action area have been designated as critical habitat for Puget Sound Chinook salmon (70 FR 52629, September 2, 2005). Coho Creek was not included in the designation.

Specific physical and biological features (PBFs) for Chinook salmon in freshwater and marine/estuarine areas, as defined by NMFS, include the following:

1. Freshwater spawning sites with water quantity and quality conditions and substrate supporting spawning, incubation and larval development

2. Freshwater rearing sites with water quantity and floodplain connectivity to form and maintain physical habitat conditions and support juvenile growth and mobility; water quality and forage supporting juvenile development; and natural cover such as shade, submerged and overhanging large wood, log jams and beaver dams, aquatic vegetation, large rocks and boulders, side channels, and undercut banks
3. Freshwater migration corridors free of obstruction with water quantity and quality conditions and natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, side channels, and undercut banks supporting juvenile and adult mobility and survival
4. Estuarine areas free of obstruction with water quality, water quantity, and salinity conditions supporting juvenile and adult physiological transitions between freshwater and saltwater; natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, and side channels; and juvenile and adult forage, including aquatic invertebrates and fishes, supporting growth and maturation
5. Nearshore marine areas free of obstruction with water quality and quantity conditions and forage, including aquatic invertebrates and fishes supporting growth and maturation; and natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, and side channels
6. Offshore marine areas with water quality conditions and forage, including aquatic invertebrates and fishes, supporting growth and maturation

Freshwater and estuarine habitats in Quilceda Creek and Ebey Slough in the action area are expected to support PBFs 2, 3, and 4. Based on the lack of potentially suitable spawning substrates, Quilceda Creek in the action area is not expected to support PBF 1 for Chinook salmon.

2.3.2 Puget Sound Steelhead Critical Habitat

Portions of Ebey Slough and Quilceda Creek in the action area have been designated as critical habitat for Puget Sound steelhead (81 FR 9251, February 24, 2016). Coho Creek was not included in the designation.

Critical habitat for Puget Sound steelhead is defined by the same PBFs as those identified above for Chinook salmon. Based on the lack of potentially suitable spawning substrates in the action area, freshwater and estuarine habitats in Quilceda Creek and Ebey Slough are expected to support PBFs 2, 3, and 4 of critical habitat for Puget Sound steelhead.

2.3.3 Bull Trout Critical Habitat

Critical habitat for bull trout was designated in September 2005 (70 FR 56211) and was revised on October 18, 2010 (75 FR 63897). Only Ebey Slough within the action area is designated as critical habitat. Quilceda Creek and Coho Creek are not mapped as critical habitat for bull trout. Therefore, only the applicable PBFs related to marine nearshore habitats are listed below.

Specific PBFs for bull trout in marine nearshore areas, as defined by USFWS, include the following:

2. Migration habitats with minimal physical, biological, or water quality impediments between spawning, rearing, overwintering, and freshwater and marine foraging habitats, including but not limited to permanent, partial, intermittent, or seasonal barriers

3. An abundant food base, including terrestrial organisms of riparian origin, aquatic macroinvertebrates, and forage fish

5. Water temperatures ranging from 2 to 15 °C (36 to 59 °F), with adequate thermal refugia available for temperatures that exceed the upper end of this range. Specific temperatures within this range will depend on bull trout life-history stage and form; geography; elevation; diurnal and seasonal variation; shading, such as that provided by riparian habitat; streamflow; and local groundwater influence.

8. Sufficient water quality and quantity such that normal reproduction, growth, and survival are not inhibited

All of these PBFs are present in Ebey Slough in the action area.

2.3.4 Southern Resident Killer Whale Critical Habitat

Designated critical habitat for SRKWs in Washington includes most of Puget Sound and the Strait of Juan de Fuca (71 FR 69054, November 29, 2006). Waters less than 20 feet deep relative to extreme high water are not considered to be within the geographical area occupied by SRKWs and are not included in the critical habitat designation. The outfalls in Ebey Slough that will receive discharges from project-related stormwater facilities are in waters less than 20 feet deep relative to extreme high water. Therefore, no SRKW critical habitat is present in the action area.

3. Environmental Setting

The action area is in a largely developed and rapidly urbanizing setting in the Puget Sound Lowlands. Portions of the project area west of I-5 are in the Tulalip Reservation. Reservation lands along 4th Street and 88th Street NE in the action area are zoned for commercial uses; some residential-zoned areas are nearby. Portions of the project area east of I-5 are in the Marysville city limits. Areas along 4th Street are in the densely developed Downtown Commercial zone, and areas along 88th Street NE are zoned as Community Business. Nearly all parcels within 0.25 mile of the two interchanges are developed to their maximum zoning potential.

According to the WSDOT Traffic GeoPortal, the average daily volume of traffic on I-5 at 4th Street (northbound and southbound combined) was 107,000 vehicles per day in 2020. The northbound and southbound on- and off-ramps at that interchange carried between 6,400 and 15,000 vehicles per day. The average volume on 4th Street was approximately 29,000 vehicles per day. The corresponding values at the 88th Street NE interchange were 98,000 vehicles per day (I-5 mainline) and 4,500 to 11,000 vehicles per day (on- and off-ramps). The WSDOT Traffic GeoPortal does not calculate traffic volumes on 88th Street NE. However, traffic data collected in 2019 to support modeling of future scenarios showed volumes of approximately 1,900 to 2,900 vehicles per hour on 88th Street NE at the I-5 interchange, which equates to approximately 19,000 to 29,000 vehicles per day.

3.1 Terrestrial Species and Habitat

The Coho Creek corridor within the Tulalip Reservation is surrounded by a wide forested buffer and is less confined. The Quil Ceda Village Business Park is directly east of Coho Creek and north of 88th Street NE. The area west of Coho Creek in this area is largely undeveloped forest. South of 88th Street NE, Coho Creek is bordered to the east by I-5 and rural residential development to the west. The Quilceda Creek riparian corridor in the Marysville city limits is surrounded by residential and industrial land use.

At the south end of the action area there is industrial and commercial activity situated between busy transportation corridors. The Ebey Slough waterfront contains Ebey Waterfront Park, stormwater conveyance features, asphalt parking areas, boat launch facilities and associated docks, and shoreline areas.

There are no documented occurrences of rare plants or priority ecosystems within the immediate project area (WDNR 2021). However, several rare plants and rare plant communities mapped west of I 5, approximately 1,000 feet west of the project action area, are associated with the salt marsh habitat at the mouth of Quilceda Creek.

Ebey Slough and the Quilceda Creek/Coho Creek wetland and stream complex provide foraging, breeding, nesting, and overwintering habitat to a wide variety of terrestrial and aquatic species.

3.2 Aquatic Species and Habitats

The action area includes portions of three streams: Ebey Slough (an estuarine waterway at the mouth of the Snohomish River), Quilceda Creek (a tributary to Ebey Slough), and Coho Creek (a tributary to Quilceda Creek). The known or expected use of these streams by ESA-listed fish is described in Section 2.2. The

following subsections provide additional information about habitat conditions pertinent to this analysis. Information about the wetland associated with Coho Creek is also provided.

Ebey Slough

Ebey Slough is a right-bank slough channel and tidally influenced distributary of the Snohomish River. The slough diverges from the main stem of the Snohomish River approximately 8 miles upstream from the river's mouth. Ebey Slough then flows north-northwest before discharging to Possession Sound approximately 2 miles north of the Snohomish River.

The north (right) bank of Ebey Slough in the action area has been highly modified by historic and current land use practices. Riparian vegetation is limited to a narrow band, only a few feet wide, vegetated mostly with weedy herbaceous species. Bottom substrates in the action area are dominated by fines, primarily sand and silt. Maximum depths at slack tide range from 8 to 12 feet (Laughlin 2011). A total maximum daily load allocation has been established for Ebey Slough to address low concentrations of dissolved oxygen downstream of I-5 (Ecology 2021).

Adult salmonids use the lower Snohomish River estuary, including Ebey Slough, primarily as a migration corridor and as a physiologic transition zone between salt and freshwater environments. Ebey Slough also provides rearing habitat and serves as a migratory corridor for juvenile salmonids. Spawning for all salmonid species occurs farther upstream in the mainstem Snohomish, Snoqualmie, and Skykomish Rivers and their tributaries.

Quilceda Creek

Quilceda Creek is a low-gradient channel within a broad valley known as the Marysville Trough. A high groundwater table supports stream flows, and the water table fluctuates rapidly in response to precipitation (Quil Ceda Village 2009). Tidal influence in the main stem extends to a point just upstream of I-5.

Based on the high proportion of fine substrates, Quilceda Creek is considered "not properly functioning" for substrate conditions (Snohomish County 2002). Potentially suitable spawning gravels are present in some sections of the stream upstream of the action area, however. The mainstem section of Quilceda Creek east of I-5 is listed on the 303(d) list for failure to meet dissolved oxygen standards (Ecology 2021).

The known or expected use of Quilceda Creek by ESA-listed fish species is discussed in Section 2.2 of this BA. NWIFC (2022) characterizes other salmonids' use of Quilceda Creek in the action area as follows:

- Coho salmon—rearing, documented
- Cutthroat trout—rearing[1], documented
- Chum salmon—present, documented
- Pink salmon—not documented, gradient-accessible

Coho Creek

The headwaters of Coho Creek are in Quil Ceda Village on the Tulalip Reservation (Quil Ceda Village 2009). In the action area, the stream has an unconfined, low-gradient channel. Stream flows remain within

[1] Nelson, personal communication, 2022b

the moderately incised channels under normal flow conditions but quickly jump the banks into a wide floodplain during periods of higher flow. Emergent and scrub/shrub-dominated wetlands occupy the floodplain and riparian habitats. Riparian vegetation is dominated by dense reed canarygrass and common cattail, with lesser amounts of shrubs, including red-twig dogwood, black twinberry, willow, and immature red alder. Large woody material is recruited, in small amounts, where the channel is close to the interphase between wetland and upland habitats. Beaver activity is significant in the Coho Creek drainage basin. Beaver dams are present both upstream and downstream of the 88th Street NE crossing, but not within 200 feet of the road.

Substrates in the action area are dominated by fine-grained materials, primarily sand with areas of patchy gravel where conditions allow. The dominant habitat is mid-channel scour pools with depths averaging between 2 and 3 feet. Instream cover is relatively low due to the lack of large woody material. However, dense overhanging vegetation likely provides some measure of cover and refuge.

Areas of significant erosion and channel incision (exceeding 10 feet) are located approximately 0.2 mile upstream of the crossing, which has contributed to the fine sediment bedload observed in the lower reaches of the stream, including the action area. As the project reach is largely depositional, the buildup of the fine sediments limits the suitability of the project area for spawning. Overall, fine sediment deposition is a limiting factor for all salmonids in the Coho Creek system.

Coho Creek is conveyed under 88th Street NE in a 54-inch concrete pipe. WDFW biologists visited the culvert in 1999, but they were unable to evaluate its status as a fish passage barrier. Based on evidence of backwater effects (90-degree turn and scour hole upstream of the road crossing), it is likely that the culvert is undersized and presents a velocity barrier to fish under high-flow conditions.

The Tulalip Tribes have undertaken extensive habitat restoration projects in and along Coho Creek upstream of 88th Street NE. Projects have included barrier removal (18 culverts removed or replaced), spawning gravel placement, channel reconstruction, riparian planting, and placement of log habitat structures. Before these efforts began in 2001, salmonids were not known or expected to use habitats in Coho Creek. Between 2002 and 2011, Tulalip tribal biologists monitored fish use of the stream and found evidence that coho salmon, chum salmon, and cutthroat trout spawn in Coho Creek (TTED 2012; Nelson, personal communication, 2021).

Wetlands

A large wetland complex (Wetland A) is associated with Coho Creek. The wetland has emergent and scrub-shrub vegetation classes and both riverine and slope hydrogeomorphic regimes. Hydroperiods within the wetland include permanently flowing stream, seasonal ponding, and saturation. The wetland boundary extends up into the hillslope at the start of the tree line on both sides of the stream corridor. The dominant plant species in the wetland is reed canarygrass (*Phalaris arundinacea*). Additional vegetation includes common cattail (*Typha latifolia*), hardhack (*Spiraea douglasii*), redtwig dogwood (*Cornus sericea*), Himalayan blackberry (*Rubus armeniacus*), black twinberry (*Lonicera involucrata*), red alder (*Alnus rubra*), and various willows (*Salix* spp.).

4. Effects of the Action

The following subsections describe potential direct effects on ESA-listed species and critical habitat, as well as identifying delayed consequences (indirect effects) of project actions. Effects of interrelated and interdependent activities are also addressed. Direct effects include all immediate impacts from project-related actions (e.g., construction-related impacts such as noise disturbance or loss of habitat), as well as impacts stemming from actions or activities that are interrelated or interdependent to the proposed action. Delayed consequences include effects that are reasonably certain to occur as a result of the proposed action, but later in time (generally after construction is complete). Delayed consequences may result from the operation of the project (e.g., long-term reductions in the quality or extent of riparian vegetation) or from future activities related to the project (e.g., induced land use change or growth).

4.1 Direct Effects

The proposed action includes the following activities with the potential for direct effects on ESA-listed species and critical habitat in the action area:

- Construction noise and increased human activity
- Ground-disturbing work in and near streams
- Fish exclusion during stream channel realignment
- Habitat loss
- Stream habitat enhancement

The following subsections identify the potential effects of these activities on ESA-listed species and critical habitat, as well as evaluating the potential for ESA-listed species to be exposed to each activity and its potential effects.

4.1.1 Construction Noise and Increased Human Activity

The terrestrial portion of the action area extends into some nearshore marine habitats (Ebey Slough) where marbled murrelets may potentially forage. Given the distance of the construction areas from potential foraging habitat, combined with the generally high level of noise and human activity in the potentially affected portion of Ebey Slough (at and near the I-5 crossing), construction noise is extremely unlikely to affect the behavior of any murrelets that may forage in Ebey Slough.

4.1.2 Ground-disturbing Work in and Near Streams

The potential for construction-related impacts to water quality will be addressed through the implementation of conservation measures and BMPs specified in the SWPPP and TESC plan that will be prepared and implemented before project construction begins. Additionally, the measures specified in Section 1.4 will be implemented, and they will reduce or eliminate the potential for water quality impacts during construction.

Construction will require the use of heavy machinery along the banks of Coho Creek both above and below the stream's ordinary high water line. Although unlikely, accidents such as spills of hazardous materials (typically green cement or grout, fuel, oils, and hydraulic fluids) or unanticipated construction mishaps could occur. Contaminants released through such accidents would degrade water quality and/or be toxic to fish and other aquatic organisms (including larval Oregon spotted frogs, if present). The

potential effect of accidental discharges, should they occur, will be mitigated in large part by implementation of the BMPs. Adherence to the site-specific SPCC plan will minimize the potential for direct effects associated with accidental spills to insignificant levels.

The proposed action will include the temporary disturbance of soils during grading and excavating activities. Site grading and excavation could result in erosion from disturbed upland soils, potentially increasing the sediment load in runoff entering Coho Creek. Stream reconstruction activities within Coho Creek may mobilize existing bottom sediments and sediments within the existing culvert, leading to short-term increases in turbidity and sedimentation of downstream areas. No ground-disturbing work will take place in or near Quilceda Creek or Ebey Slough, nor will equipment be operated in or near either of those streams.

Sedimentation is a concern because it can increase scour potential, degrade rearing habitat, and alter riparian vegetative structure. Increased turbidity can affect both primary food production and feeding efficiency by fish and other aquatic organisms. In addition, high turbidity can impair respiration and possibly hinder salmonid reproductive efforts.

Based on the implementation of site-specific BMPs, the effects of sedimentation and turbidity within Coho Creek are anticipated to be insignificant. In addition, the likelihood of any ESA-listed fish being present in Coho Creek during construction is extremely low. As discussed in Section 2, Chinook salmon, steelhead, and bull trout are not expected to spawn in Coho Creek. In the unlikely event that any of these species do spawn in Coho Creek, work in and near the water will take place during the in-water work window (July 15 to September 30), when migrating adults, incubating eggs, and outmigrating juveniles are least likely to be present. It is possible that rearing juvenile Chinook salmon or steelhead or foraging subadult bull trout could enter Coho Creek from Quilceda Creek. The probability of this occurring is very low, however, based on the following:

- During 10 years of monitoring at the smolt trap in Coho Creek approximately 0.4 mile upstream from the project site, none of these species was observed.
- The in-water work window corresponds to the period when low flows and elevated water temperatures are expected to discourage individuals of all three species (especially bull trout) from entering Coho Creek.
- Bull trout are not expected to spawn in the Quilceda Creek system, further reducing the likelihood that adults, subadults, or juveniles may venture into Coho Creek from Quilceda Creek.
- Juvenile Chinook salmon from the Quilceda Creek system are predominantly ocean-type—that is, they migrate downstream from April to early June and are largely absent from fresh waters by mid-July.
- Tulalip tribal biologists familiar with local conditions have determined that all three species are unlikely to be present in Coho Creek during the in-water work window (Nelson, personal communication, 2022a).

Similarly, the potential for Oregon spotted frogs to be exposed to construction-related turbidity or contaminants is discountable. This conclusion is based on (1) the low probability that Oregon spotted frogs are present in the action area, (2) the implementation of BMPs designed to minimize the risk of accidental releases, and (3) the low probability for areas near the project site to provide suitable breeding habitat for Oregon spotted frogs. If Oregon spotted frogs breed near the beaver ponds upstream of the project site, dispersing juveniles might venture into the project area. Given the area's isolation from

known populations, combined with the limited quality and extent of potentially suitable breeding habitat, this is a low-probability scenario.

4.1.3 Fish Exclusion

Most construction work for building the new bridge and reconstructing the Coho Creek stream channel will be performed in the dry, outside the active channel. In-water work will be limited to activities associated with diverting flow from the existing channel to the reconstructed channel under the new bridge. Before the existing channel is dewatered and flow is directed to the new channel, fish will be excluded from the affected areas. Fish exclusion will be performed in accordance with the standards and protocols established by USFWS (2012).

Fish exclusion will occur only during the in-water work window (July 15 to September 30). As noted above, in the unlikely event that Chinook salmon, steelhead, or bull trout spawn in Coho Creek, this work will take place when migrating adults, incubating eggs, and outmigrating juveniles are least likely to be present. Also, as discussed above, the probability that individuals of any of these species might venture into the construction area during the in-water work window is very low.

Oregon spotted frogs are not expected to use habitats in the actively flowing stream channel that will be dewatered when flow is directed to the new channel. As such, fish exclusion activities have no potential to affect Oregon spotted frogs.

4.1.4 Habitat Loss

Realigning the stream channel building bridge piers and retaining walls will entail the placement of fill below the ordinary high water line of Coho Creek (see Appendix B, sheets 9 and 10). The impacts of the loss of aquatic habitat in these areas will be offset by (1) the creation of new stream channel habitat, combined with (2) the removal of the gabion-supported road fill prism that currently occupies areas that would otherwise be within the ordinary high water line of Coho Creek and/or within associated wetland and riparian areas.

Approximately 160 linear feet of existing stream channel will be filled upstream and downstream of the culvert. In its place, approximately 220 linear feet of new stream channel will be created, for a net gain of about 60 linear feet. In addition, removal of the gabion-supported road fill prism at that location will create approximately 6,300 square feet of native soils and native vegetation that support riparian and wetland functions. The change in the amount of habitat within the ordinary high water line cannot be calculated because the ordinary high water line for the new stream channel will not be established until after the channel has carried flows for at least one winter.

Stream realignment will also result in the loss of some wetland areas that have the potential to provide suitable habitat for Oregon spotted frogs. As with stream channel habitat, these losses will be offset. As shown in Appendix B (sheets 9 and 10), approximately 6,100 square feet of Wetland A will be affected by structural fill (about 4,400 square feet) or stream channel creation (about 1,700 square feet). However, approximately 6,300 square feet of gabion-supported road fill prism will be removed, and approximately 1,400 square feet of stream channel will be filled. These areas, totaling about 7,700 square feet, will be planted with native species. Over time, these areas are expected to support wetland functions, potentially resulting in a net increase of approximately 1,600 square feet of wetland area at the project site. In addition, all impacts to wetlands, streams, and their regulatory buffers will be mitigated in accordance

with applicable tribal, federal, state, and local requirements. There will be no net loss of wetland area or ecological functions. The project is expected to result in a significant improvement in system processes and ecological functions of wetlands and streams after fill removal associated with the bridge construction.

Removal of the undersized culvert may reduce the amount of area affected by backwatering during high-flow events in Coho Creek. Based on low gradients, abundant beaver activity, and groundwater availability in Wetland A upstream of 88th Street NE, this change will not be expected to affect the hydrology of Wetland A. Modeling indicates that the project will not affect the water surface elevation in Coho Creek during a 2-year storm event. Measurable changes in water surface elevations would occur only during significantly larger storm events, which do not play a major role in determining wetland hydrology. For these reasons, the total area of Wetland A is not expected to change.

4.1.5 Stream Habitat Enhancement

Culvert removal, bridge construction, and stream channel realignment will have the following beneficial effects in the action area:

- A net increase of approximately 60 linear feet of surface-flowing stream habitat
- The replacement of approximately 6,300 square feet of gabion-supported road fill prism with native soils and native vegetation that support riparian functions
- Improved habitat conditions due to the placement of large woody material in and near the stream channel
- Increased availability of potentially suitable spawning substrates in the newly constructed channel
- Improved connectivity between the stream and its floodplain where the existing gabion-supported road fill prism is removed
- Improved movement of sediments through the system due to stream channel realignment and removal of the undersized culvert
- A potential net increase of approximately 1,600 square feet of wetland habitat that has the potential to support breeding, rearing, and overwintering by Oregon spotted frogs
- Improved access to approximately 65,000 linear feet (12.3 miles) of stream habitat in the Coho Creek system upstream of 88th Street NE (Shattuck, personal communication, 2021)

As discussed in Section 3.2 of this BA, the Tulalip Tribes have implemented extensive habitat improvement projects in Coho Creek, and the Tribes are developing plans for additional restoration. Removal of the undersized culvert at 88th Street NE will render those areas more accessible to anadromous salmonids, including ESA-listed species.

4.2 Delayed Consequences

Analyses in this section address the potential for effects resulting from long-term reductions in the quality or extent of riparian vegetation, changes in the amount of impervious surface in the action area, and potential changes in land use. Also addressed are potential impacts on prey species for SRKWs.

4.2.1 Riparian Habitat Modification

Bridge construction and stream channel realignment will entail clearing vegetation in the riparian zone along Coho Creek. Temporarily disturbed areas within the riparian zone will be replanted with native species that support riparian ecological functions. Currently, the predominant vegetation cover in the affected areas is Himalayan blackberry. Removal of this invasive species and planting native species will likely contribute to improved riparian habitat quality over time. In addition, approximately 6,300 square feet of gabion-supported road fill prism will be replaced with native soils and native vegetation, increasing the amount of area that provides riparian ecological functions.

Safety standards require that only low-stature species will be allowed to grow within 10 feet of the new bridge. Mature forest habitat will not develop in those areas, reducing the potential for recruitment of large woody material to the stream over the long term. This reduction will be offset by the placement of more than 60 pieces of large woody material in and near the stream as part of the project design.

4.2.2 Stormwater

Project construction will decrease the amount of PGIS in the action area by 0.24 acre while increasing the amount being treated and/or infiltrated by 5.90 acres (Table 1). Given the marked increase in the amount of PGIS receiving water quality treatment, combined with the overall reduction in PGIS area, the project is expected to decrease the pollutant loading in runoff to waters that support ESA-listed fish. The amounts of net change in PGIS and area being treated and/or infiltrated vary from TDA to TDA. Currently, runoff from 12.57 acres of PGIS in the nine TDAs does not receive treatment; the project will decrease that amount to 6.42 acres (Table 1). In eight of the nine TDAs, the amount of PGIS being treated or infiltrated will increase. The one exception is TDA 2, which is discussed in the evaluation of the potential delivery of stormwater to Quilceda Creek (see below).

In contrast to PGIS, the total area impervious surfaces will increase overall, by 1.27 acre. Flow control will be provided in compliance with the requirements of the Highway Runoff Manual.

Runoff from PGIS created or replaced by the project will be treated in accordance with the guidelines in the current Stormwater Management Manual for Western Washington, which represents the best available science for stormwater treatment and flow control. As discussed in Section 1.3.1, runoff from 90 percent of impervious surfaces (pollution-generating or non-pollution-generating) created or replaced in most TDAs will be routed to infiltration facilities. Implementation of these practices, combined with an overall reduction in the amount of PGIS, is expected to reduce the potential for ESA-listed species to be exposed to elevated concentrations of pollutants (including dissolved metals and other chemical contaminants) in runoff from impervious surfaces created or replaced by the project.

Nevertheless, residual contaminants in stormwater runoff from PGIS can harm ESA-listed fish, even after the water has been treated to reduce pollutant loads. ESA-listed fish in receiving waters may be exposed to contaminants in stormwater that is discharged to the receiving waters, or they may be exposed by consuming contaminated prey. The likelihood and magnitude of the effect are related to the length of time fish spend in the action area.

Recent research has found 6PPD-quinone, a contaminant found in runoff from roadways, to be a major contributor to pre spawning mortality in coho salmon (Tian et al. 2021). The effects of this contaminant on other salmonids (including ESA-listed Chinook salmon, steelhead, and bull trout) have not been studied in depth. The concentration at which 6PPD-quinone may have toxic effects on those species is

unknown, as is the effectiveness of stormwater treatment facilities in reducing its concentration in stormwater runoff. However, the use of bioretention facilities, such as those proposed for this project, has been found to prevent the acute lethal effects of stormwater on salmonids (Spromberg et al. 2015).

The concentrations of contaminants that remain in stormwater discharged to receiving waters are unknown, and they are expected to be highly variable. Similarly, the distance from the outfall to the point where the contaminants dilute to levels too low to cause detectable effects is also unknown and expected to be highly variable. Runoff volumes vary and depend on the timing, intensity, and duration of individual storm events. Contaminant concentrations are likely to be greatest during first-flush events, after contaminants have accumulated on roadways during long periods of dry weather. Such events are most common in early and mid-autumn.

Another significant factor is the system that conveys the stormwater to receiving waters. Where water is conveyed in open, vegetated ditches, contaminant concentrations are reduced through infiltration and adsorption to organic matter. Fewer opportunities for such reductions occur in conveyance systems that consist primarily of pipes.

The following subsections analyze the potential impacts of stormwater on ESA-listed fish in each of the three receiving waters (Ebey Slough, Quilceda Creek, and Coho Creek).

Ebey Slough

Ebey Slough receives stormwater runoff directly from TDAs 3 and 4 and indirectly from TDA 1.

Runoff from TDA 1 is discharged to a wetland that borders Ebey Slough; the discharge point is approximately 1,200 feet from the water's edge. In addition, the project will result in a net decrease in the PGIS in the TDA, as well as increasing the amount of impervious surface receiving water quality treatment (Table 1). Based on the distance from the discharge point to Ebey Slough, the potential for ESA-listed fish to be exposed to residual contaminants in treated runoff from TDA 1 is negligible.

Stormwater runoff from TDA 3 will be treated and discharged to an outfall in Ebey Slough immediately west of I-5. Under current conditions, runoff from TDA 3 does not receive any treatment before it is discharged to Ebey Slough. The project will result in a net increase of 0.43 acre of PGIS in TDA 3, and it will provide treatment for 0.41 acre (Table 1). Based on these factors, the project may not result in an appreciable reduction in contaminant levels in runoff from TDA 3. However, any residual contaminants that may remain in treated runoff from this TDA will be diluted almost immediately upon entering Ebey Slough.

Stormwater runoff from TDA 4 will be directed to the new regional stormwater treatment facility being developed by the City. Under current conditions, runoff from TDA 4 does not receive any treatment. The project will result in a minuscule net increase in the amount of PGIS in TDA 4 (0.01 acre), and it will provide treatment for an approximately equal area (Table 1). Although this change does not have a high likelihood of reducing the contaminant levels in runoff from TDA 4, the areas involved are minuscule relative to the total area that will be directed to the regional stormwater facility.

Infiltration and treatment that occur in these facilities and conveyance systems are expected to reduce the loadings of contaminants in stormwater that is discharged from the project site to Ebey Slough, compared to current conditions. Residual contaminants in treated stormwater, as well as contaminants in untreated runoff from existing PGIS in these TDAs, will be diluted almost immediately upon entering

Ebey Slough. Runoff from the approximately 7 acres of PGIS in these three TDAs represents a tiny proportion of the flow that enters Ebey Slough from the Snohomish River basin.

ESA-listed fish are likely to be exposed to contaminants in stormwater runoff from the project area only if they are present near the discharge points during or shortly after a storm event. Following are evaluations of the exposure potential for the various life stages of ESA-listed fish that may be present in Ebey Slough.

- Adult Chinook salmon may encounter stormwater discharges while they are passing through Ebey Slough en route to spawning grounds in the Snohomish River system from June through September. Given the small area where elevated contaminant concentrations occur (in the immediate vicinity of the discharge points), the infrequent occurrence of storm events during that period, and the brief duration of their presence (adults are not expected to linger in the estuary before heading upstream), the potential for exposure is very low.
- Juvenile Chinook salmon may be present in Ebey Slough in low densities at most times of the year, with higher densities in May and June. As with adults, only the individuals that venture close to the discharge points will be at risk of exposure. The overwhelming majority of storm events, including first-flush events, occur when densities are relatively low, minimizing the potential for exposure.
- Adult steelhead may encounter stormwater discharges while they are passing through Ebey Slough en route to spawning grounds in the Snohomish River system. Given the presence of both summer-run and winter-run steelhead in the system, migrating adults may be present in the slough at almost any time of year. Only the individuals that venture close to the discharge points will be at risk of exposure.
- Juvenile steelhead typically do not linger in the estuarine environment. Outmigrating smolts may be present from mid-April through August, but their presence is expected to be brief and transitory. Given the small area where elevated contaminant concentrations occur (in the immediate vicinity of the discharge points), the infrequent occurrence of storm events during that period, and the brief duration of the juveniles' presence, the potential for exposure is very low.
- Adult bull trout are most likely to be present in Ebey Slough from April through July or August. Given the small area where elevated contaminant concentrations occur (in the immediate vicinity of the discharge points) and the infrequent occurrence of storm events during this period, the potential for exposure is very low. In addition, the anadromous life history form makes up a limited proportion of the bull trout population in the Snohomish River system; the number of adults that may enter Ebey Slough is comparatively small.
- Subadult bull trout typically overwinter in reaches of the Snohomish River upstream of Ebey Slough. They are not expected to be exposed to discharges from stormwater facilities.
- Juvenile bull trout may be present between mid-April and mid-July. Similar to steelhead, their presence is expected to be brief, transitory, and at low densities. Given the small area where elevated contaminant concentrations occur (in the immediate vicinity of the discharge points), the infrequent occurrence of storm events during that period, and the brief duration of the juveniles' presence, the potential for exposure is very low.

Quilceda Creek

Quilceda Creek receives stormwater runoff from TDAs 2, 6, 7, 8 and 9. The following paragraphs evaluate the project's effects on contaminant levels in runoff that enters Quilceda Creek from those TDAs. Notably, runoff from the equivalent of 90 percent of all impervious surfaces (pollution-generating or non-pollution-generating) created or replaced in four of these five TDAs (6, 7, 8, and 9) will be routed to infiltration facilities.

Under current conditions, runoff from TDA 2 does not receive any treatment before it is discharged to Quilceda Creek. By reducing the area of PGIS in the TDA by 0.09 acre, the project is expected to reduce contaminant levels in runoff from TDA 2, compared to current conditions. Additional reduction of contaminant levels will occur through adsorption to soils and vegetation in conveyance ditches between the project site and the stream. Based on the small area of impervious surfaces in this TDA, project-driven changes in contaminant levels are not expected to have a detectable effect on water quality in Quilceda Creek.

Under current conditions, runoff from TDA 6 does not receive any treatment before it is discharged to Quilceda Creek. The project will result in a net increase of 0.01 acre of PGIS in TDA 6, an amount that is dwarfed by the amount of impervious surfaces that will receive treatment in the TDA (0.62 acre). As discussed in Section 1.3.1, much of the runoff from TDA 6 infiltrates in conveyance ditches and never enters Quilceda Creek. Contaminant levels in any water that reaches the stream are further reduced through adsorption to soils and vegetation in the ditches. Based on these factors, contaminant levels in runoff that reaches Quilceda Creek from TDA 6 are very low under current conditions and will decrease substantially after the project is complete.

Under current conditions, runoff from 0.62 acre of impervious surfaces in TDA 7 receives partial treatment in a bioswale. The project will result in a net increase of 0.10 acre of PGIS and a net increase of 1.31 acres receiving treatment. As discussed in Section 1.3.1, much of the runoff from this TDA infiltrates in conveyance ditches and never enters Quilceda Creek. Contaminant levels in any water that reaches the stream are further reduced through adsorption to soils and vegetation in the ditches. Based on these factors, contaminant levels in runoff that reaches Quilceda Creek from TDA 7 are very low under current conditions and will decrease substantially after the project is complete.

Under current conditions, runoff from 1.28 acres of impervious surfaces in TDA 8 drains to a stormwater treatment pond that is believed to outfall to Quilceda Creek north of 88th Street NE. Currently, the stormwater pond occasionally experiences flooding. The project will result in a net decrease of 0.04 acre of PGIS and a net increase of 0.15 acre receiving treatment. By creating a new infiltration facility, the project will reduce the amount of runoff directed to the stormwater pond, reducing the risk of the pond's capacity being exceeded during major storm events. As a result, contaminant levels in runoff that reaches Quilceda Creek from TDA 8 are expected to decrease after project completion.

Under current conditions, runoff from 0.13 acre of impervious surfaces in TDA 9 flows to a bioswale—approximately two-thirds of the total impervious surface area in the TDA. The project will result in a net increase of 0.03 acre of PGIS and a net increase of 0.07 acre receiving treatment. Based on these factors, contaminant levels in runoff that reaches Quilceda Creek from TDA 9 are very low under current conditions and will decrease after the project is complete.

Infiltration and treatment that occur in these facilities and conveyance systems are expected to reduce the loadings of contaminants in stormwater that is discharged from the project site to Quilceda Creek,

compared to current conditions. Although the volume of flow in Quilceda Creek is not as great as that in Ebey Slough, the combined area of the PGIS in these five TDAs (approximately 5 acres) is extremely small compared to the contributing watershed area upstream of their discharge points (approximately 20,000 acres).

To be cautious, it is assumed for this analysis that runoff from project-related impervious surfaces may contain elevated levels of contaminants from the upstream-most discharge point (that of TDA 8) all the way down to the mouth of the stream in Ebey Slough, a distance of approximately 3.7 miles. It is quite likely, however, that residual contaminants in treated stormwater, as well as contaminants in untreated runoff from impervious surfaces in these TDAs, will be diluted to insignificant levels a short distance downstream of each discharge point. Moreover, TDAs 6 and 7 encompass more than half of the impervious surface area that drains to Quilceda Creek. Most runoff from these two TDAs infiltrates in conveyance ditches and does not enter the stream. These factors, combined with the high proportion of runoff from PGIS in these TDAs that will receive treatment after the project is complete (4.18 of 5.36 acres—nearly 80 percent), indicate a low likelihood that harmful levels of contaminants will enter Quilceda Creek from these five TDAs.

Following are evaluations of the exposure potential for the various life stages of ESA-listed fish that may be present in Quilceda Creek.

- Small numbers of adult Chinook salmon are expected to pass through the action area en route to spawning grounds upstream. They may enter the stream as early as June and be present until spawning is complete in late November. Migrating adults are likely to encounter runoff from project-related impervious surfaces as they pass through the action area during this period, which includes the early and mid-autumn period when first-flush events are most likely to occur. Exposure to elevated levels of contaminants will be relatively brief, as the fish are expected to keep moving upstream until they encounter suitable spawning habitat.
- Juvenile Chinook salmon may rear in the action area, but they are more likely to use Quilceda Creek in the action area as a migratory corridor as they move to marine habitats from spawning and rearing areas upstream. Juvenile Chinook salmon from the Quilceda Creek system are predominantly ocean-type—that is, they rear in freshwater habitats for a relatively brief period before migrating downstream. Juvenile Chinook salmon are largely absent from Quilceda Creek by mid-July each year.
- Adult steelhead are expected to pass through the action area en route to spawning grounds upstream. Winter-run steelhead may pass through reaches of Quilceda Creek in the action area between November and April. If summer-run steelhead spawn in the system, they may pass through the action area May and October (as noted in Section 2.2.3, it is unlikely that many summer-run steelhead are present in Quilceda Creek).
- Juvenile steelhead may rear in the action area. Because rearing juveniles may rear in freshwater systems for several years, juvenile steelhead could be present in Quilceda Creek in the action area at any time of year and could, thus, be exposed to contaminants in runoff from project-related impervious surfaces.
- Bull trout are not expected to spawn in the Quilceda Creek system. For this reason, exposure to runoff from project-related impervious surfaces would occur only if individual bull adults or

subadults from other systems were to venture into the stream. Any such expeditions would likely involve individual fish and would occur only infrequently.

Coho Creek

Coho Creek receives stormwater runoff from TDA 5. Under current conditions, runoff from 1.54 acres of impervious surfaces in this TDA flows to a bioswale. The project will result in a net decrease of 0.41 acre of PGIS, and it will nearly double the area receiving treatment (increasing to 2.98 acres). As a result, contaminant levels in runoff from TDA 5 are expected to decrease, compared to current conditions. In addition, the discharge point for the new facility will be in Wetland A. Under most conditions, additional contaminant removal will occur via infiltration and adsorption in the soils and vegetation of the wetland before entering the stream. During major storm events, the water level in the stream may be high enough to reach the end of the discharge pipe.

No ESA-listed fish have been documented in Coho Creek, even during 10 years of monitoring of the smolt trap approximately 0.4 mile upstream of 88th Street NE. Nevertheless, it is possible that individuals of any of these species may enter the stream on occasion. The likelihood of presence is greatest near the confluence of Coho Creek with Quilceda Creek, approximately 0.8 mile downstream from the TDA 5 discharge point. Over that distance, contaminant levels will be reduced as substances in the stormwater interact with soils and vegetation and are diluted by flow entering the stream from adjacent wetlands. The probability that any ESA-listed fish may be exposed directly to effluent discharged from TDA 5 is extremely low. The risks of exposure for the various life stages of each species are evaluated below.

- Adult Chinook salmon migrating upstream in Quilceda Creek could stray into Coho Creek. Based on the absence of a spawning population in Coho Creek, combined with poor habitat conditions (low flows, high temperatures, and a preponderance of fine substrates), any such occurrences would likely be temporary and brief.
- If any juvenile Chinook salmon rear in the lower reaches of Quilceda Creek, they, too, could stray into Coho Creek. As discussed above, the action area is in the lower reaches of Quilceda Creek, downstream of known spawning areas. Juvenile Chinook salmon are not expected to remain in those reaches for extended periods. In addition, to be exposed to undiluted effluent from TDA 5, juveniles from Quilceda Creek would have to swim upstream in Coho Creek for approximately 0.8 mile. Taken together, these factors suggest the likelihood of exposure is discountable.
- Similar to adult Chinook salmon, spawning and migrating adult steelhead may stray into Coho Creek. Based on the absence of a spawning population of steelhead in Coho Creek, combined with poor habitat conditions (the preponderance of fine substrates, in particular), any such occurrences would likely be temporary and brief.
- Juvenile steelhead that rear in Quilceda Creek could stray into Coho Creek. The potential for this to occur is greater than for Chinook salmon because juvenile steelhead tend to remain in freshwater systems for several years. In addition, as they age and become stronger swimmers, juvenile steelhead will have a greater ability to venture into the reaches of Coho Creek near the TDA 5 discharge point. However, the lack of detections during 10 years of smolt trap monitoring at 27th Avenue NE suggests a low probability that juvenile steelhead may venture that far upstream in Coho Creek.

- As noted above, bull trout are not expected to spawn in the Quilceda Creek system, which includes Coho Creek. For this reason, exposure to runoff from project-related impervious surfaces would occur only if individual bull trout (adults, subadults, or juveniles) from other systems were to venture into the stream. Any such expeditions would likely involve individual fish and would occur only infrequently.

4.2.3 Changes in Land Use

As required by WSDOT (2020), the May 2009 interagency guidance for addressing delayed consequences was employed to determine whether the proposed project has the potential for delayed consequences resulting from changes in land use. Responses to applicable questions in the guidance document are provided below.

Question 1: Will the project create a new facility (e.g., new road, new interchange, etc.)?

Response: No.

Question 2: Will the project improve a level of service of an existing facility as established in local plans?

Response: Yes, probably. *The purpose of the project includes improving mobility for cars, trucks, emergency services, pedestrians, and transit users traveling to, from, and across I-5 on 4th Street and 88th Street NE and within the Tulalip Reservation. The project is consistent with the City of Marysville's 88th Street Master Plan (Ordinance No. 2865, June 13, 2011). That plan includes requirements for roadway and intersection improvements to accommodate ingress and egress for the 88th Street Master Plan area. The plan states that ingress and egress shall be located as far from the State Avenue//88th Street NE intersection as possible and shall be restricted to right-in/right-out only. The plan also includes a requirement for additional right-of-way along 88th Street NE to accommodate an eastbound through lane for the 88th Street NE/State Avenue intersection. That intersection is approximately 0.25 mile east of the project footprint. Nevertheless, to be cautious, this analysis assumes the project will improve level of service at both the 4th Street and the 88th Street NE interchanges as established in local plans.*

Based on these responses, the delayed consequences analysis guidelines require responses to the five questions (a through e) below.

a) Is there a building moratorium in place that is contingent on the proposed road improvements?

Response: No. *Analysts found no evidence that a building moratorium is in place near either interchange or that the project has been identified as a requirement for development of any proposed or permitted developments.*

b) Are there any land use changes tied by permit condition to the proposed project?

Response: No. *Analysts have not identified any developments tied to the project by permit condition.*

c) Do the project's National Environmental Policy Act documents identify other actions or land use changes caused by or resulting from the project that are reasonably certain to occur?

Response: No. *National Environmental Policy Act documentation has not yet been prepared for this project.*

d) Do development plans include scenarios for the planning area where land use differs based on a "build" and "no-build" outcome related to the proposed project?

Response: No. *Tribal and City development plans do not include scenarios based on different outcomes for this project.*

e) Is there land use change that is likely to occur at a different rate as a result of the project?

Response*:* ***No.*** *Based on the plan area's distance from the project site, the proposed improvements are not expected to accelerate the implementation of the City of Marysville's 88th Street Master Plan. In addition, there is no evidence that the Tulalip Tribes or the City have any plans to change existing Comprehensive Plan designations or zoning in response to this project. The increased efficiency of the intersections is expected to reduce congestion, but it is not expected to influence the rate of development in the area. Growth and development in the area are ongoing and expected to continue at approximately the same rate with or without the I-5/4th Street and 88th Street NE Corridor Improvements project.*

Based on the above responses, the I-5/4th Street and 88th Street NE Corridor Improvements Project is not expected to contribute to the conversion of currently undeveloped or underdeveloped parcels in the action area to a more developed condition. Even if that were to occur, however, such projects would not be expected to result in substantial increases in runoff from pollution-generated impervious surfaces associated with new development. First, the project area is in a densely developed urban setting with a fully developed road network. In addition, any future development projects in and near the action area will be subject to independent environmental review and permitting by various tribal, federal, state, and local agencies, limiting the potential for adverse effects on ESA-listed species. For example, regulations at both the state and the local level require the inclusion of stormwater treatment facilities in most projects that create new or expand existing impervious surface area (e.g., WAC 173-201A, Water Quality Standards for Surface Waters of the State of Washington). They require that stormwater be treated or detained before it is released to local streams to minimize its detrimental effects on aquatic species and their habitats. In addition, point source stormwater discharges to surface waters from construction sites of 1 acre or larger are required to obtain a National Pollutant Discharge Elimination System permit from Ecology. Compliance with these and other requirements will minimize the potential for adverse effects on ESA-listed species and habitat from future development projects.

Based on the above, it is possible, but unlikely, that completion of the I-5/4th Street and 88th Street NE Corridor Improvements project could contribute to delayed consequences related to increased pollutant loadings in runoff from future development projects. The likelihood of any such effects will be minimized, if not entirely avoided, through implementation of measures aimed at minimizing adverse effects on fish and wildlife species and habitat.

4.2.4 Impacts on Prey Species

Impacts to SRKWs as a result of impacts on prey species will be generally beneficial. Overall, the stream enhancement component of the project will provide access to additional upstream habitat potentially suitable to spawning. Any negative effects on SRKW prey species during fish-exclusion activities will be

minimal and short-lived. Potential stormwater-related impacts on Chinook salmon will be limited to the Quilceda Creek population, which is dwarfed by populations in the nearby Snohomish River system. These effects will not translate into population-level effects that would measurably reduce the availability of prey species for SRKWs. As such, the potential for adverse impacts on the availability of food resources for SRKWs is discountable, and the outcome of any such impacts would be insignificant.

In-water work has the potential to displace prey species for both Chinook salmon and steelhead. The effects of any such displacement would be localized and temporary, and prey species would be expected to return following construction. Given the availability of prey in adjacent habitats, the proposed action is anticipated to have an insignificant effect on the availability of prey for Chinook salmon and steelhead.

4.3 Effects on the Physical and Biological Features of Critical Habitat

4.3.1 PBFs for Puget Sound ESU Chinook Salmon and Puget Sound DPS Steelhead

PBFs essential to the conservation of the Puget Sound ESU Chinook salmon and Puget Sound DPS steelhead in freshwater and estuarine habitats are present in the action area, as identified in Section 2.3.1 and Section 2.3.2. Potential project-related effects on each of those PBFs are discussed below.

PBF 2 (freshwater rearing sites)

The only designated critical habitat in freshwater habitats in the action area is in Quilceda Creek. The project will not entail any work in or near Quilceda Creek. However, contaminants in runoff from impervious surfaces may degrade water quality for juvenile Chinook salmon and juvenile steelhead that rear in Quilceda Creek in the action area.

PBF 3 (freshwater migration corridors)

The only designated critical habitat in freshwater habitats in the action area is in Quilceda Creek. The project will not entail any work in or near Quilceda Creek. However, contaminants in runoff from impervious surfaces may degrade water quality for adult Chinook salmon and steelhead that migrate through Quilceda Creek in the action area to spawning areas upstream. Contaminants may also degrade water quality for outmigrating juveniles.

PBF 4 (estuarine habitats)

The project will have no direct effects on physical or biological components of estuarine habitats. No project work will take place within Ebey Slough. As discussed in Section 4.2.2, any residual contaminants in runoff from project-related impervious surfaces will be diluted to levels too low to detectably degrade water quality almost immediately upon entering Ebey Slough.

4.3.2 PBFs for Bull Trout

PBFs essential to the conservation of bull trout in marine nearshore areas are present in the action area, as identified in Section 2.3.1. Potential project-related effects on each of those PBFs are discussed below.

PBF 2 (migration habitats)

Under current conditions, the project area contains no permanent, partial, or seasonal physical, biological, or water quality impediments that prevent migration between spawning, rearing, overwintering, and freshwater and marine foraging habitats.

The project will not entail any work in or near Ebey Slough and, as such, will have no direct effects on physical or biological components of estuarine habitats. As discussed in Section 4.2.2, any residual contaminants in runoff from project-related impervious surfaces will be diluted to levels too low to detectably degrade water quality almost immediately upon entering Ebey Slough.

PBF 3 (food base)

The project is not expected to have any detectable direct or indirect effects on the availability of prey for bull trout in Ebey Slough.

PBF 5 (water temperatures)

The project will not modify any riparian vegetation near Ebey Slough, nor will it affect the temperature of any waters being discharged to Ebey Slough. As such, the project will have no effect on water temperatures in Ebey Slough.

PBF 5 (water quality and quantity)

As discussed in Section 4.2.2, any residual contaminants in runoff from project-related impervious surfaces will be diluted to levels too low to detectably degrade water quality almost immediately upon entering Ebey Slough. Given the small area of impervious surfaces contributing runoff to Ebey Slough, relative to the flow of the Snohomish River basin, the project has no potential for any detectable effects on water quantity in Ebey Slough.

4.4 Effects of Interrelated and Interdependent Actions

Compensatory mitigation, if required, will likely be accomplished by using hand tools to plant native trees and shrubs in areas near the project alignment. As such, compensatory mitigation will have little or no potential for adverse effects on ESA-listed species. If mitigation for project-related impacts to wetlands and wetland buffers may result in impacts to ESA-listed species and habitats not considered in this analysis, those impacts will be addressed through future consultation.

4.5 Cumulative Impacts

Consistent with the requirements specified in 50 CFR 402.02, the analysis of cumulative effects is based on future actions that are (1) reasonably certain to occur in the action area, and (2) not expected to include a federal nexus that would trigger ESA Section 7 compliance requirements.

Development projects may also contribute to increased pollutant loading in waters that support ESA-listed fish. No planned projects with that potential have been identified in the action area. Any future projects will have to comply with state and local regulations that protect wetlands, streams, and other critical areas. Such reviews will trigger the implementation of mitigation measures and practices aimed at avoiding or minimizing the potential for adverse effects on wetlands, aquatic species and habitat, and other natural resources such as fish and wildlife habitat conservation areas. Compliance with those requirements will

ensure that any future development projects in the action area are unlikely to result in adverse impacts to water quality in waterbodies that support ESA-listed fish.

Based on the above, the I-5/4th Street and 88th Street NE Corridor Improvements Project is not expected to contribute to adverse cumulative effects on ESA-listed species when considered in conjunction with other reasonably foreseeable future projects.

5. Conclusions and Effect Determinations

The following subsections present effect determinations and rationales for the ESA-listed species and designated critical habitat not addressed in previous consultations. See Section 2.2 for no-effect determinations for species identified by USFWS as potentially having to be considered in the effects analysis for this project.

5.1 Marbled Murrelet

The project **may affect** marbled murrelets for the following reasons:

- Marbled murrelets may forage in the estuarine habitats in Ebey Slough in the action area.
- A 10-acre stand of mature conifer trees is present in the action area.

The project is **not likely to adversely affect** marbled murrelets for the following reasons:

- Given the distance of the construction areas from potential foraging habitat, combined with the generally high level of noise and human activity in the potentially affected portion of Ebey Slough (at and near the I-5 crossing), construction noise is extremely unlikely to affect the behavior of any murrelets that may forage in the action area.
- No suitable nesting habitat is located within 15 miles of the project area.
- The 10-acre stand of mature conifer trees is dense, isolated, and extremely unlikely to support nesting by marbled murrelets (see Section 2.2.1 for additional details).

5.2 Puget Sound Chinook Salmon

The project **may affect** Puget Sound Chinook salmon for the following reasons:

- Stormwater detention and treatment facilities that receive runoff from impervious surfaces created or replaced by the project will discharge to waters where Chinook salmon adults and juveniles may be present.
- In-water work, including fish exclusion, will take place in waters that are accessible to Chinook salmon.

The project is **likely to adversely affect** Puget Sound Chinook salmon for the following reasons:

- Water discharged from detention and treatment facilities may contain residual concentrations of contaminants that may be toxic to Chinook salmon.

The project is not likely to appreciably reduce the survival and recovery of Puget Sound Chinook salmon for the following reasons:

- The treatment of stormwater will reduce contaminant levels in runoff from the project area, compared to current conditions.
- Residual contaminant levels will be further reduced by dilution, infiltration, and adsorption to organic materials as water travels in ditches between stormwater facilities and fish-bearing waters.
- Any residual contaminants in water from stormwater facilities that discharge into Ebey Slough will be diluted to negligible levels almost immediately after the water enters the estuarine environment.

- Chinook salmon are unlikely to be present in the portion of Coho Creek that will receive discharge from stormwater facilities.
- Work in Coho Creek will be restricted to the in-water work window, when neither adult nor juvenile Chinook salmon are expected to be present.
- The potential for delivery of sediment or contaminants during construction will be minimized through implementation of the measures specified in Section 1.4.
- The project will enhance stream habitat in Coho Creek and will allow improved access to more than 65,000 linear feet of upstream habitat.

5.3 Critical Habitat for Puget Sound Chinook Salmon

The project **may affect** critical habitat for Puget Sound Chinook salmon for the following reasons:

- Stormwater detention and treatment facilities that receive runoff from impervious surfaces created or replaced by the project will discharge to waters where critical habitat has been designated for Puget Sound Chinook salmon.

The project is **likely to adversely affect** critical habitat for Puget Sound Chinook salmon for the following reasons:

- Contaminants in runoff from impervious surfaces may degrade water quality in reaches of Quilceda Creek that are designated as critical habitat and that support the rearing and migration PBFs.

5.4 Puget Sound Steelhead

The project **may affect** Puget Sound steelhead for the following reasons:

- Stormwater detention and treatment facilities that receive runoff from impervious surfaces created or replaced by the project will discharge to waters where steelhead adults and juveniles may be present.
- In-water work, including fish exclusion, will take place in waters that are accessible to steelhead.

The project is **likely to adversely affect** Puget Sound steelhead for the following reasons:

- Water discharged from detention and treatment facilities may contain residual concentrations of contaminants that may be toxic to steelhead.

The project is not likely to appreciably reduce the survival and recovery of Puget Sound steelhead for the following reasons:

- The treatment of stormwater will reduce contaminant levels in runoff from the project area, compared to current conditions.
- Residual contaminant levels will be further reduced by dilution, infiltration, and adsorption to organic materials as water travels in ditches between stormwater facilities and fish-bearing waters.
- Any residual contaminants in water from stormwater facilities that discharge into Ebey Slough will be diluted to negligible levels almost immediately after the water enters the estuarine environment.

- Steelhead are unlikely to be present in the portion of Coho Creek that will receive discharge from stormwater facilities.
- Work in Coho Creek will be restricted to the in-water work window, when neither adult nor juvenile steelhead are expected to be present.
- The potential for delivery of sediment or contaminants during construction will be minimized through implementation of the measures specified in Section 1.4.
- The project will enhance stream habitat in Coho Creek and will allow improved access to more than 65,000 linear feet of upstream habitat.

5.5 Critical Habitat for Puget Sound Steelhead

The project **may affect** critical habitat for Puget Sound steelhead for the following reasons:

- Stormwater detention and treatment facilities that receive runoff from impervious surfaces created or replaced by the project will discharge to waters where critical habitat has been designated for Puget Sound steelhead.

The project is **likely to adversely affect** critical habitat for Puget Sound steelhead for the following reasons:

- Contaminants in runoff from impervious surfaces may degrade water quality in reaches of Quilceda Creek that are designated as critical habitat and that support the rearing and migration PBFs of critical habitat for Puget Sound steelhead.

5.6 Bull Trout

The project **may affect** bull trout for the following reasons:

- Stormwater detention and treatment facilities that receive runoff from impervious surfaces created or replaced by the project will discharge to waters where bull trout adults, subadults, and juveniles may be present.
- In-water work, including fish exclusion, will take place in waters that are accessible to bull trout.

The project is **not likely to adversely affect** bull trout for the following reasons:

- Bull trout are not expected to spawn in the Quilceda Creek system. Exposure to runoff from project-related impervious surfaces would occur only if individual bull adults or subadults from other systems were to venture into Quilceda Creek. The potential for such a visit to correspond with a storm event that discharges large amounts of contaminants to the stream is discountable. In addition, the impacts of any such exposure would likely be insignificant because the visit would be brief and transitory.
- The potential for exposure to project-related runoff to Ebey Slough is discountable, based on (1) the small area where elevated contaminant concentrations may occur, (2) the infrequent occurrence of storm events during the periods when adult or juvenile bull trout may be present in Ebey Slough, and (3) the small numbers of bull trout that are likely to be present.

5.7 Critical Habitat for Bull Trout

The project **may affect** critical habitat for bull trout for the following reasons:

- Stormwater detention and treatment facilities that receive runoff from impervious surfaces created or replaced by the project will discharge to marine nearshore waters where critical habitat has been designated for bull trout.

The project is **not likely to adversely affect** critical habitat for bull trout for the following reasons:

- The project will not entail any work in or near Ebey Slough and, as such, will have no direct effects on physical or biological components of marine nearshore habitats.
- Any residual contaminants in runoff from project-related impervious surfaces will be diluted to levels too low to detectably degrade water quality almost immediately upon entering Ebey Slough.

5.8 Oregon Spotted Frog

The project **may affect** Oregon spotted frogs for the following reasons:

- The project site is in a watershed where potentially suitable habitats have the potential to support populations of Oregon spotted frogs.
- Project construction will entail clearing and ground-disturbing work in a wetland complex (Wetland A) that contains potentially suitable breeding, rearing, and overwintering habitat for Oregon spotted frogs.

The project is **not likely to adversely affect** Oregon spotted frogs for the following reasons:

- The closest known extant population of Oregon spotted frogs is approximately 30 miles north of the action area.
- Tulalip tribal biologists have not observed any Oregon spotted frogs while performing field work in wetlands throughout the watershed.
- Given the proximity of forest cover and the predominance of dense, monocultural stands of reed canarygrass, habitats near the project site are unlikely to provide suitable oviposition sites for Oregon spotted frogs.
- Large areas of suitable wetland habitat will remain undisturbed in areas of the Wetland A complex upstream and downstream of the project site.
- Biologists will perform pre-construction surveys for Oregon spotted frog egg masses in potentially suitable habitat associated with Coho Creek near the 88th Street NE bridge construction site. If Oregon spotted frog egg masses are discovered, BIA and WSDOT will coordinate with USFWS on the implementation of additional conservation measures.
- Removal of the undersized culvert is not expected to affect the hydrology or extent of Wetland A.

5.9 Southern Resident Killer Whale

The project **may affect** southern resident killer whales for the following reason:

- The project may adversely affect Chinook salmon, a primary prey source for this species.

The project is **not likely to adversely affect** southern resident killer whales for the following reasons:

- The project will not appreciably reduce the survival and recovery of Chinook salmon and will not, therefore, result in any population-scale reductions in the availability of this prey resource for southern resident killer whales.
- Southern resident killer whales are not known or expected to use habitats in the action area and will not be exposed to any other potential project-related impacts.

APPENDIX A

ESSENTIAL FISH HABITAT ASSESSMENT

Essential Fish Habitat Background

The Magnuson-Stevens Fishery Conservation and Management Act, as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267), requires federal agencies to consult with NMFS on activities that may adversely affect EFH.

The EFH designation for the Pacific salmon fishery includes all streams, lakes, ponds, wetlands, and other water bodies currently or historically accessible to salmon in Washington, Oregon, Idaho, and California, except above the impassable barriers identified by the Pacific Fishery Management Council (PFMC 1999). In estuarine and marine environments, proposed designated EFH extends from near-shore and tidal submerged environments within state territorial waters to the full extent of the exclusive economic zone offshore of Washington, Oregon, and California north of Point Conception (PFMC 1999).

The Pacific salmon management unit includes Chinook, coho, and pink salmon. Of the managed Pacific salmon species, all three species have been identified as having EFH within the project area. Quilceda Creek and Coho Creek within the project area provide potential foraging, rearing, and spawning habitat. Ebey Slough serves as migration corridor for all three species and provides important rearing habitat for both juvenile Chinook and juvenile coho salmon.

In addition to Pacific salmon, EFH has been designated for groundfish and coastal pelagic species. EFH for Pacific coast groundfish is generally defined as the aquatic habitat from the mean higher high water line, and the upriver extent of saltwater intrusion in river mouths seaward. Pacific coast groundfish that may potentially occur within the action area during some life history phase include spiny dogfish, California skate, ratfish, lingcod cabezon, kelp greenling, Pacific cod, Pacific whiting (hake), sablefish, bocaccio, brown rockfish, copper rockfish, quillback rockfish, English sole Pacific sanddab, rex sole, and starry flounder. The Coastal Pelagic Species Fishery Management Plan describes the habitat requirements of five pelagic species: northern anchovy, Pacific sardine, Pacific (chub) mackerel, jack mackerel, and market squid (PFMC 1998). These four finfish and market squid are treated as a single species complex because of similarities in their life histories and habitat requirements. EFH for coastal pelagic species is generally defined as all marine and estuarine waters from the shoreline offshore above the thermocline.

The objective of this EFH assessment is to determine whether the proposed action "may adversely affect" designated EFH for relevant commercially, federally managed fisheries species within the proposed action area. It also describes conservation measures proposed to avoid, minimize, or otherwise offset potential adverse effects on designated EFH resulting from the proposed action.

Description of the Proposed Action

The proposed project is described in detail in Section 1.3 of this BA.

Potential Adverse Effects of the Proposed Project

Potential impacts of the proposed action to ESA-listed fish species and habitats are discussed in Section 4 of this BA and are expected to be similar for all federally managed fish species that occur in the action area.

Adverse Effects on Essential Fish Habitat for Salmonids

Potential adverse effects on EFH for salmonids will be associated with reduced water quality (sedimentation and turbidity) resulting from realignment of the Coho Creek channel. In addition, contaminants in stormwater runoff discharged to Ebey Slough, Quilceda Creek, and Coho Creek could adversely affect EFH for salmonids.

Construction-related disturbance of sediments will be minimized by adherence to a TESC plan and installation and monitoring of appropriate erosion control BMPs during construction, limiting earthwork to only those areas necessary to complete that phase of construction, stabilization of disturbed soils shortly after work is completed, and adhering to approved in-water work windows. These effects are anticipated to be short in duration and are not expected to persist following construction.

Potential adverse effects associated with contaminants in stormwater runoff will be minimized by directing runoff to treatment and infiltration facilities.

Adverse Effects on Essential Fish Habitat for Groundfish

Contaminants in the effluent from stormwater facilities that discharge to Ebey Slough may pose adverse effects on groundfish in the estuary. Sediment and turbidity disturbances related to construction activities in Coho Creek (approximately 2.5 miles upstream of Ebey Slough) are not expected to reduce water quality within the estuary.

Adverse Effects on Essential Fish Habitat for Coastal Pelagic Species

Potential adverse effects on EFH for coastal pelagic species are similar to those discussed above for groundfish.

Essential Fish Habitat Conservation Measures

Conservation measures and BMPs are included for project activities and are described in Section 1.4 (Performance Standards and Impact Avoidance and Minimization Measures) of this BA. In addition, the project includes habitat enhancement and access improvement measures that will have beneficial effects on EFH for Pacific salmon in freshwater habitats.

Conclusions

EFH for Pacific salmon, groundfish, and coastal pelagic species are present in the action area. Construction activities in and near Coho Creek may increase sediment loads and turbidity, potentially degrading water quality. These effects will be short-lived and will not persist beyond the construction period. Over the long term, contaminants in effluent from stormwater facilities that discharge to freshwater and estuarine environments in the action area may pose adverse effects to EFH for salmonids, groundfish, and coastal pelagic species.

Based on the continued presence of contaminants in stormwater runoff discharged to Quilceda Creek and Coho Creek, the proposed action **may adversely affect** EFH for Pacific salmon.

Any residual contaminants in runoff from project-related impervious surfaces will be diluted to levels too low to detectably degrade water quality almost immediately upon entering Ebey Slough. For this reason, the project **will not adversely affect** EFH for groundfish or coastal pelagic species.

In Reply Refer To: March 18, 2022
Project Code: 2022-0021758
Project Name: I-5/4th Street and 88th Street NE Corridor Improvements

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)

(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF

Migratory Birds: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts see https://www.fws.gov/birds/policies-and-regulations.php.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures see https://www.fws.gov/birds/bird-enthusiasts/threats-to-birds.php.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/birds/policies-and-regulations/executive-orders/e0-13186.php.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Project Summary

Project Code: 2022-0021758
Event Code: None
Project Name: I-5/4th Street and 88th Street NE Corridor Improvements
Project Type: Road/Hwy - Maintenance/Modification
Project Description: The Tulalip Tribes, in partnership with the Washington State Department of Transportation and the City of Marysville, propose to develop and implement access improvements to two interchanges on the Interstate 5 (I-5) corridor within the boundary of the Tulalip Reservation in Snohomish County, Washington. The two interchanges are at 4th Street (also known as State Route 528 and Marine Drive) and 88th Street NE. The purpose of the I-5/4th Street and 88th Street Corridor Improvements project is to support community and economic vitality by reducing congestion and improving mobility for cars, trucks, emergency services, pedestrians, and transit users traveling to, from, and across I-5 on 4th Street and 88th Street NE and within the Tribes' Reservation while enhancing safety and protecting the integrity of the interstate system. The federal nexus for this project is approvals by the Bureau of Indian Affairs for expansion of existing road rights of way on tribal lands. Project construction is expected to require 2 years, with an anticipated start date of January 2024. All construction activities below the ordinary high water lines of streams will occur during the in-water work window established by the Tribes (July 15 through September 30).

Project Location:

Approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@48.06377355,-122.1846441,14z

Counties: Snohomish County, Washington

Endangered Species Act Species

There is a total of 5 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

Birds

NAME	STATUS
Marbled Murrelet *Brachyramphus marmoratus* Population: U.S.A. (CA, OR, WA) There is **final** critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/4467	Threatened
Streaked Horned Lark *Eremophila alpestris strigata* There is **final** critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/7268	Threatened
Yellow-billed Cuckoo *Coccyzus americanus* Population: Western U.S. DPS There is **final** critical habitat for this species. The location of the critical habitat is not available. Species profile: https://ecos.fws.gov/ecp/species/3911	Threatened

Fishes

NAME	STATUS
Bull Trout *Salvelinus confluentus* Population: U.S.A., conterminous, lower 48 states There is **final** critical habitat for this species. Your location overlaps the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/8212	Threatened

Insects

NAME	STATUS
Monarch Butterfly *Danaus plexippus*	Candidate

No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/9743

Critical habitats

There is 1 critical habitat wholly or partially within your project area under this office's jurisdiction.

APPENDIX D

OREGON SPOTTED FROG HABITAT ASSESSMENT

Oregon Spotted Frog Habitat Assessment

I-5/4th Street and 88th Street NE Corridor Improvements

Below are pertinent excerpts from WSDOT's February 17, 2015, guidance document for assessing the potential presence of and habitat use by Oregon spotted frogs in a project area. Excerpts from the guidance document are shown in Times New Roman typeface. Responses to questions in that document appear in Calibri typeface (*blue italics*).

1. Is the project in one of the following watersheds? Baker River, Black River- Chehalis River, Chambers Creek-Frontal Puget Sound, Chapman Creek, Finney Creek- Skagit River, Fraiser Creek, Green River Kent, Lacamas Creek, Lower Nisqually River- Frontal Puget Sound, Lower Snoqualmie River, Lower Trout Lake Creek, Outlet Creek, Quilceda Creek-Frontal Possession Sound, Samish River, Skagit River-Frontal Skagit Bay, South Fork Nooksack River, Sumas River, Wallace River-Skykomish River, Woods Creek-Skykomish River.
   The project site is in the Quilceda Creek-Frontal Possession Sound watershed.
2. Is the project in Oregon Spotted Frog Critical Habitat?
   No.
3. Is the project likely to impact any aquatic (pond, channel, ditch, river, stream, lake) or wetland (including seasonally flooded pastures, disturbed or farmed wetlands etc.) habitat?
   Yes. Construction of a bridge in place of the culvert that conveys Coho Creek under 88th Street NE will affect Coho Creek and associated wetlands.

Office Screening Model

a. Do the soils consist of loams (silt, clay, fine sandy gravelly, cobbly and stony), mucks (e.g., Semiahmoo, Mukilteo), loamy sands, or other poorly drained fibisols, mesisols, organic cryosols, gleysols, or umisols?
   Mapped soils include Norma loam, a poorly drained, hydric soil.
b. Does the action area lie between sea level and 1,100 feet in elevation?
   The action area is below 1,100 feet elevation.
c. Do any of the following types occur within the action area? [wetland types identified by the Washington Department of Ecology or the National Land Cover map; waterways identified in the National Hydrology Dataset]
   The Washington Department of Ecology modeled wetlands inventory shows Palustrine Scrub/Shrub Wetland and Palustrine Forested Wetland types in the project area.
   The National Land Cover map shows areas of herbaceous emergent wetlands and woody wetlands in the project area.
   The National Hydrology Dataset shows a permanent watercourse (Coho Creek) at the project site.

On-Site Screening Model

a. Evaluate the action area for Breeding habitat

i. Contains low-gradient shallows with extensive areas < 12 inches deep.
The floodplain along Coho Creek supports areas of low-gradient shallows less than 12 inches deep during the breeding season.

ii. Inundated for at least 5 weeks during late winter/early spring, starting as early as February.
Based on the low-gradient basin and high groundwater table in the action area, combined with observations of extensive inundation during wetland delineation and rating surveys in November 2020, it is probable that areas of shallow inundation are present in the wetlands associated with Coho Creek for at least 5 weeks during late winter and early spring.

iii. Dominated by (constituting > 50% of existing vegetative cover) emergent wetland vegetation. Ideal vegetation cover would be plants such as *Carex*, *Eleocharis*, *Juncus*, *Sparganium*, *Spiraea*, *Potamogeton*, *Scirpus*, *Utricularia*, *Ranunculus*, filamentous algae, and native grasses, but which may also contain subdominant vegetation of other plant species having an upright submergent or emergent growth form. However, most OSF occupied areas are dominated by reed canarygrass (*Phalaris*), therefore, do not discount this vegetation type as breeding habitat.
Floodplain habitat along Coho Creek near the project site consists of a relatively narrow corridor (approximately 100 feet wide) of reed canarygrass-dominated vegetation surrounded by conifer-dominated forest. About 1,000 feet upstream of the project site, the corridor of low-growing vegetation broadens to approximately 200 feet wide, where a series of beaver ponds is evident in aerial imagery. The total area of the non-forested corridor is approximately 6 acres.
Biologists performing wetland surveys in November 2020 did not record any observations of native grasses or other herbaceous plants from the genera listed above. The timing of those surveys likely hindered plant identification, however. Given the proximity of forest cover and the predominance of dense, monocultural stands of reed canarygrass, habitats near the project site are unlikely to provide suitable oviposition sites for Oregon spotted frogs.

iv. Have > 10% plant coverage of bottom substrate, primarily in submergent and emergent growth forms. Reed canarygrass may be managed to replicate short, emergent vegetation.
Vegetation cover exceeds 50%. As noted above, wetland vegetation near the project site consists predominantly of dense stands of unmanaged reed canarygrass.

v. Have low surface and above-water canopy closure in the form of woody-stemmed shrubs and trees, excepting the margins (within 50 ft of open expanses) of deciduous forest stands where leaf-out occurs after egg-laying.
Most areas of low-growing vegetation near the project site are less than 50 feet from conifer-dominated forest.

vi. Remain connected to summer-season habitat by still or slow-moving surface waters until post hatching in an average year. This period will be 5-8 weeks from the date of egg deposition and will usually occur by June 30 in an average year.
Areas of still or slow-moving surface water are expected to persist in the stream's floodplain through June in most years.

b. Evaluate the action area for suitable summer-season features.

i. Contains persistent (perennial) lentic pools, ditches, canals, or slow-moving rivers…
The Coho Creek basin in the action area has a high groundwater table and a low-gradient floodplain. Flows are expected to be perennial. Numerous slow-moving, braided channels that meander throughout the floodplain provide persistent lentic habitat.
…that:

- Have emergent, floating, or submergent wetland vegetation growth forms.
  Emergent vegetation, consisting of reed canarygrass and giant horsetail, is present.
- May have palustrine forested vegetation including *Spiraea*, *Salix* or *Alnus* in shrub or tree form or upland shrub-tree form vegetation present and within a distance that provides at least partial shading.
  Trees (red alder) and shrubs (willows, hardhack) are present nearby and provide ample shade.
- Are/become connected via suitable surface water to winter habitat during the fall.
  Based on the perennial flows, floodplain channels are expected to maintain a surface water connection to suitable winter habitat during the fall.

c. Evaluate the site for winter habitat.

i. Contains ponded, pooled or channeled areas of either lotic or lentic water that:

- Exceed 6" in depth.
  During a site visit on November 20, 2020, biologists noted multiple stream channels and ponding, with water depths ranging from 12 inches to 2.5 feet. Such habitat is likely to be present throughout a typical winter season.
- Have some combination of aquatic bed, emergent, and scrub-shrub vegetation present and intermixed with unconsolidated bottom habitat.
  Braided channels meander through emergent (reed canarygrass and cattail) and scrub-shrub (hardhack and willow) vegetation throughout the floodplain. Abundant fine sediments and organic material create unconsolidated bottom habitat throughout.
- Are not scoured (scoured = having flows capable of removing rooted vegetation or re-arranging distribution of large- grained sand and gravel substrates) by winter storm-related flows during an average year.
  The stream is in a relatively flat basin, with an approximately 1- to 2-percent gradient. During higher flows, the stream does not tend to rearrange or distribute larger substrates. Only one area of scour was observed during the field visit.
- Are inundated from at least October through March.
  The braided channels in the floodplain are expected to be perennially inundated.

Cultural Resource Correspondence

United States Department of the Interior

BUREAU OF INDIAN AFFAIRS
Northwest Regional Office
911 Northeast 11th Avenue
Portland, Oregon 97232

In Reply Refer To:
DIVISION OF ENVIRONMENTAL & CULTURAL RESOURCE MGMT.

Dr. Allyson Brooks
Washington State Historic Preservation Officer
Department of Archaeology and Historic Preservation
P.O. Box 48343
Olympia, Washington 98504-8343

RE: I-5/4th Street and 88th Street NE Corridor Improvements Project, Snohomish County, Washington DAHP Project No. 2022-06-04118

Dear Dr. Brooks:

The Bureau of Indian Affairs (BIA) Northwest Regional Office (NWRO) is conducting National Historic Preservation Act (NHPA) Section 106 consultation with your office regarding the I-5/4th Street and 88th Street NE Corridor Improvements Project which is within the boundaries of the Tulalip Indian Reservation. The BIA is initiating consultation with your office under the standard review process (36 CFR Part 800). We are requesting your review of the attached Cultural Resources Assessment.

The APE for the proposed project is located in Sections 16, 17, 20 and 21, Township 30 North, Range 5 East. The interchanges at 4th Street and 88th Street are within the city of Marysville, Washington. Maps are included in the attached Cultural Resources Assessment (CRA) for your reference.

As noted in the CRA, there are no known or identified archaeological or historic resources within the APE. The Tulalip Tribe, as noted in the attached Report, will have a monitor on hand along with an Inadvertent Discovery Policy in the unlikely event that any resources are discovered.

Therefore, the BIA, as per §36 CFR 800.5(b), has determined that the implementation of the proposed undertaking will result in a 'No Adverse Effect' to historic properties by implementing the proposed project. Please direct any questions or requests for additional information to Eirik Thorsgard, Regional Archaeologist, at eirik.thorsgard@bia.gov or (503) 231-6921.

Sincerely,

Bryan Mercier
Northwest Regional Director

Allyson Brooks Ph.D., Director
State Historic Preservation Officer

October 11, 2022

Mr. Bryan Mercier
Northwest Regional director
US Bureau of Indian Affairs

In future correspondence please refer to:
Project Tracking Code: 2022-06-04148
Property: I-5/4th Street and 88th Street NE Corridor Improvements
Re: No Historic Properties Affected

Dear Mr. Mercier:

Thank you for contacting the Washington State Historic Preservation Officer (SHPO) and Department of Archaeology and Historic Preservation (DAHP) regarding the above referenced proposal. Your communication on this action has been reviewed on behalf of the SHPO under provisions of Section 106 of the National Historic Preservation Act of 1966 (as amended) and 36 CFR Part 800. Our review is based upon documentation provided in your submittal.

First, we concur with the project area of potential effect (APE) as mapped in your documentation. We also concur that no historic properties will be affected by the current project as proposed. As a result of our concurrence, further contact with DAHP on this proposal is not necessary.

However, if new information about affected resources becomes available and/or the project scope of work changes significantly, please resume consultation as our assessment may be revised. Also, if any archaeological resources are uncovered during construction, please halt work immediately in the area of discovery and contact the appropriate Native American Tribes and DAHP for further consultation.

Thank you for the opportunity to review and comment. If you have any questions, please feel free to contact me.

Sincerely,

Dennis Wardlaw
Transportation Archaeologist

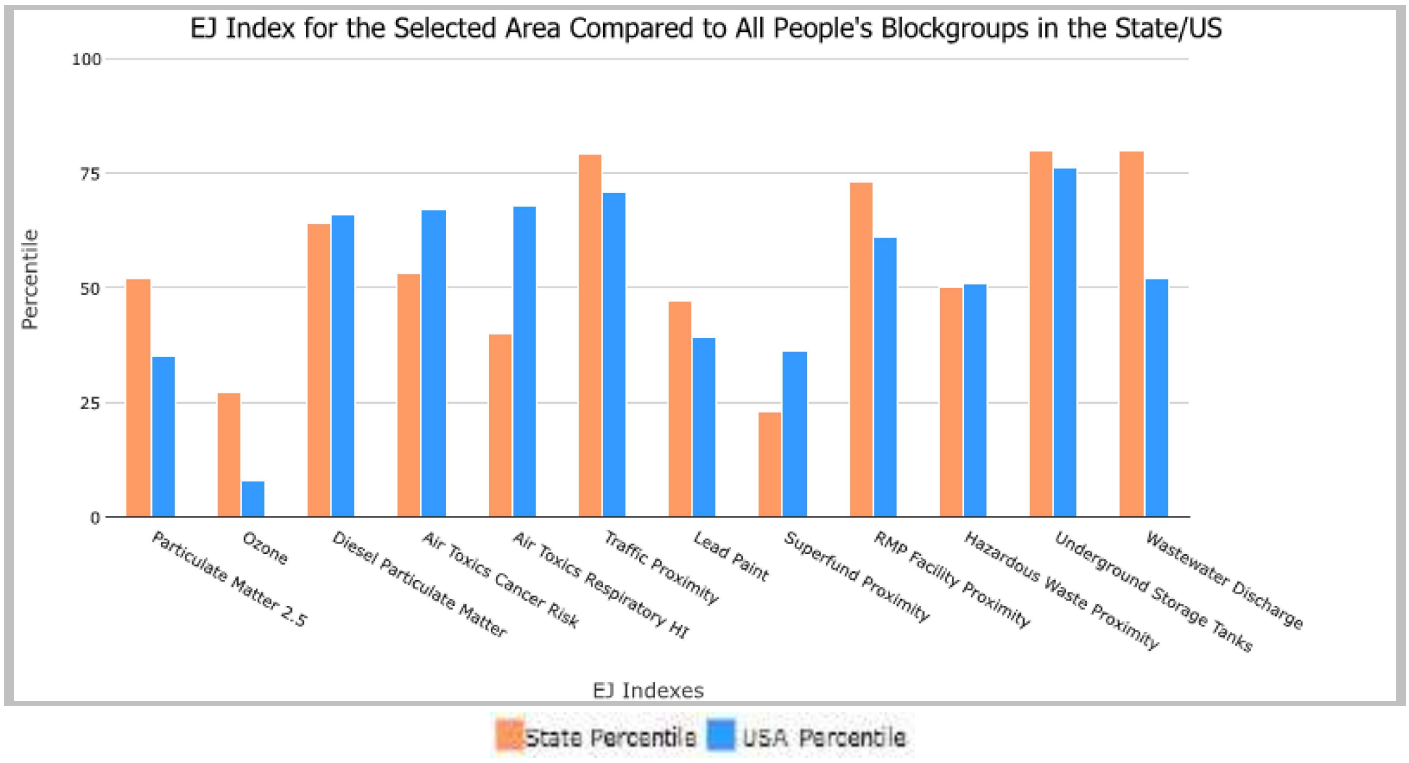
EJ Index for RMP Facility Proximity	73	61
EJ Index for Hazardous Waste Proximity	50	51
EJ Index for Underground Storage Tanks	80	76
EJ Index for Wastewater Discharge	80	52



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

*Diesel particular matter, air toxics cancer risk, and air toxics respiratory hazard index are from the EPA's Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. Cancer risks and hazard indices from the Air Toxics Data Update are reported to one significant figure and any additional significant figures here are due to rounding. More information on the Air Toxics Data Update can be found at: https://www.epa.gov/haps/air-toxics-data-update.

For additional information, see: www.epa.gov/environmentaljustice

EJScreen is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJScreen documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJScreen outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

*Diesel particular matter, air toxics cancer risk, and air toxics respiratory hazard index are from the EPA's Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. Cancer risks and hazard indices from the Air Toxics Data Update are reported to one significant figure and any additional significant figures here are due to rounding. More information on the Air Toxics Data Update can be found at: https://www.epa.gov/haps/air-toxics-data-update.

For additional information, see: www.epa.gov/environmentaljustice

EJScreen is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJScreen documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJScreen outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

EJScreen is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJScreen documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJScreen outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

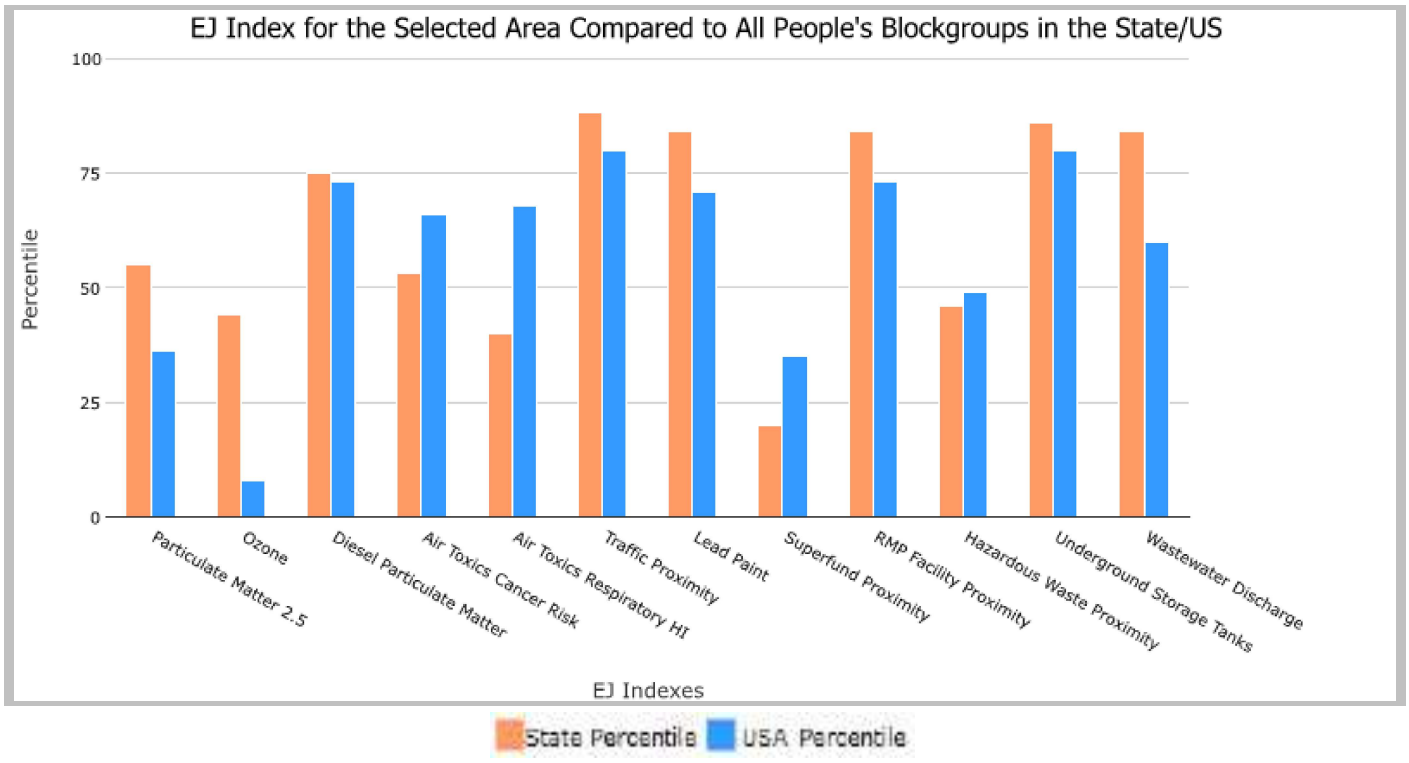
EJ Index for RMP Facility Proximity	84	73
EJ Index for Hazardous Waste Proximity	46	49
EJ Index for Underground Storage Tanks	86	80
EJ Index for Wastewater Discharge	84	60



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

*Diesel particular matter, air toxics cancer risk, and air toxics respiratory hazard index are from the EPA's Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. Cancer risks and hazard indices from the Air Toxics Data Update are reported to one significant figure and any additional significant figures here are due to rounding. More information on the Air Toxics Data Update can be found at: https://www.epa.gov/haps/air-toxics-data-update.

For additional information, see: www.epa.gov/environmentaljustice

EJScreen is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJScreen documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJScreen outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

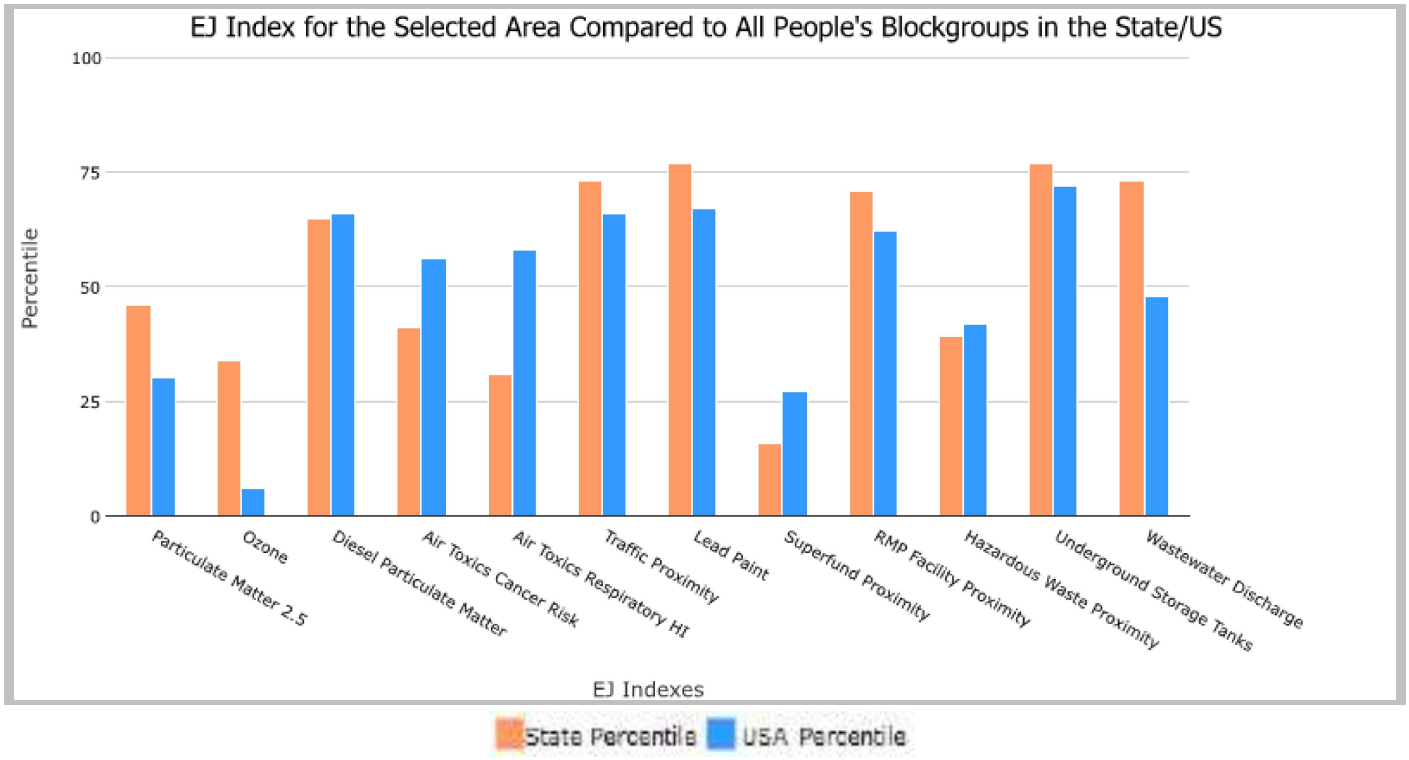
EJ Index for RMP Facility Proximity	71	62
EJ Index for Hazardous Waste Proximity	39	42
EJ Index for Underground Storage Tanks	77	72
EJ Index for Wastewater Discharge	73	48



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

*Diesel particular matter, air toxics cancer risk, and air toxics respiratory hazard index are from the EPA's Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. Cancer risks and hazard indices from the Air Toxics Data Update are reported to one significant figure and any additional significant figures here are due to rounding. More information on the Air Toxics Data Update can be found at: https://www.epa.gov/haps/air-toxics-data-update.

For additional information, see: www.epa.gov/environmentaljustice

EJScreen is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJScreen documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJScreen outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

*Diesel particular matter, air toxics cancer risk, and air toxics respiratory hazard index are from the EPA's Air Toxics Data Update, which is the Agency's ongoing, comprehensive evaluation of air toxics in the United States. This effort aims to prioritize air toxics, emission sources, and locations of interest for further study. It is important to remember that the air toxics data presented here provide broad estimates of health risks over geographic areas of the country, not definitive risks to specific individuals or locations. Cancer risks and hazard indices from the Air Toxics Data Update are reported to one significant figure and any additional significant figures here are due to rounding. More information on the Air Toxics Data Update can be found at: https://www.epa.gov/haps/air-toxics-data-update.

For additional information, see: www.epa.gov/environmentaljustice

EJScreen is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJScreen documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJScreen outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

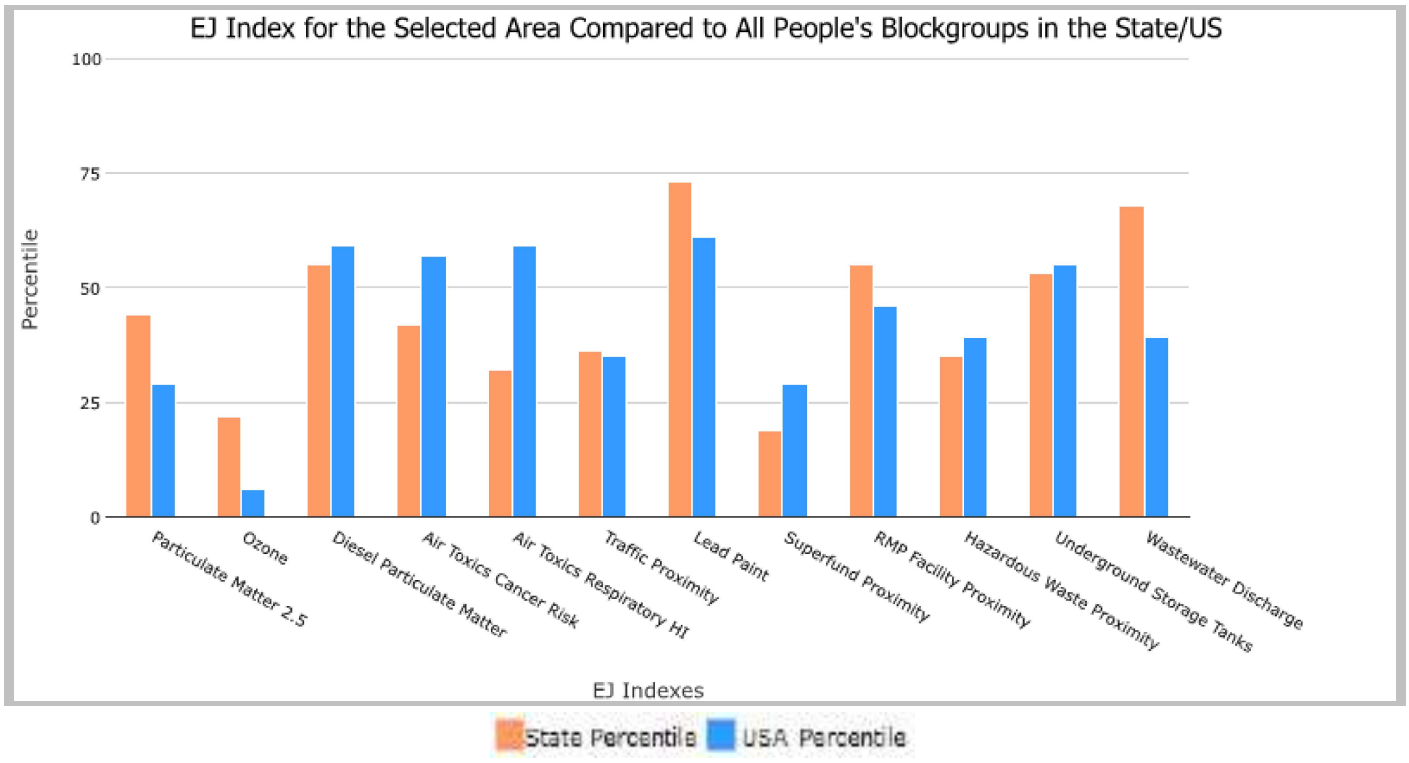
EJ Index for Wastewater Discharge	68	39



This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

This report shows the values for environmental and demographic indicators and EJSCREEN indexes. It shows environmental and demographic raw data (e.g., the estimated concentration of ozone in the air), and also shows what percentile each raw data value represents. These percentiles provide perspective on how the selected block group or buffer area compares to the entire state, EPA region, or nation. For example, if a given location is at the 95th percentile nationwide, this means that only 5 percent of the US population has a higher block group value than the average person in the location being analyzed. The years for which the data are available, and the methods used, vary across these indicators. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJSCREEN documentation for discussion of these issues before using reports.

EJScreen is a screening tool for pre-decisional use only. It can help identify areas that may warrant additional consideration, analysis, or outreach. It does not provide a basis for decision-making, but it may help identify potential areas of EJ concern. Users should keep in mind that screening tools are subject to substantial uncertainty in their demographic and environmental data, particularly when looking at small geographic areas. Important caveats and uncertainties apply to this screening-level information, so it is essential to understand the limitations on appropriate interpretations and applications of these indicators. Please see EJScreen documentation for discussion of these issues before using reports. This screening tool does not provide data on every environmental impact and demographic factor that may be relevant to a particular location. EJScreen outputs should be supplemented with additional information and local knowledge before taking any action to address potential EJ concerns.

1. INTRODUCTION

This Hazardous Materials Discipline Report was prepared for the Tulalip Tribes to document the hazardous materials impacts associated with the I-5/4th Street and 88th Street NE Corridor Improvements project (the project). The project will provide improvements in the vicinity of two interchanges at I-5 and 4th Street and 88th Street NE (see Figure 1-1). The primary purpose of this report is to (1) identify potential sources of hazardous substances and/or petroleum products that may include an existing release, a past release, or a material threat of a release of hazardous substances or petroleum products to soil, groundwater, or surface water and (2) evaluate whether the releases could affect the environment or create significant construction impacts. Such impacts could affect worker safety, property value, and/or project costs.

1.1 Project Description

The project is located at I-5 in the vicinity of two interchanges: 4th Street and 88th Street NE (see Figure 1-1). The project will provide improvements to the two interchanges and will consist of the following elements:

- Construction of seven roundabouts to replace existing signaled intersections
- Channelization improvements entering and exiting the roundabouts
- Reconfigured pedestrian and bicycle access along the alignment
- Construction of new flow control and water quality treatment facilities for runoff from new and replaced impervious surfaces
- Construction of a bridge to replace the existing road fill prism and an undersized culvert on Coho Creek at 88th Street NE

The Tulalip Tribes initiated the project to support community and economic vitality by reducing congestion and improving mobility for cars, trucks, emergency services, pedestrians, and transit users traveling to, from, and across I-5 on 4th Street and 88th Street NE and within the Tribes' Reservation while enhancing safety and protecting the integrity of the interstate system.

The project area is defined as the limits of anticipated construction, acquired property and right-of-way (ROW), and temporary constructions easements. The vicinity of the project area is shown on Figure 1-1. The study area for this discipline was defined as the project area plus the standard search distances for environmental databases as defined in the American Society for Testing and Materials (ASTM) Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (E-1527-21) (ASTM 2021).

Acquired property is expected along existing ROW; adjacent to I-5 on- and off-ramps; along 88th Street NE and its intersections with 34th and 36th Avenue NE; and along 4th Street and its intersections with 33rd Avenue NE and Beach Avenue.

Excavation associated with project activities is expected to include grading for ROW expansion and ramp construction; utility installation and relocation; and bridge construction (piers are anticipated to be completed to approximately 90 to 120 feet below ground surface).

Marysville, WA

1.2 Methodology

The purpose of this report is to evaluate, in compliance with the National Environmental Policy Act, the potential for encountering hazardous materials or petroleum hydrocarbons as a result of project activities.

This report will be prepared in accordance with Chapter 447 of the Washington Department of Transportation (WSDOT) Environmental Procedures Manual (WSDOT 2022), which is consistent with ASTM guidelines and the WSDOT Guidance and Standard Methodology for Hazardous Materials Discipline Reports (WSDOT 2017).

The following sources were used to evaluate the potential for encountering contamination in the subsurface as a result of project activities.

1.2.1 Regulatory Database Review

Pertinent state and federal regulatory database information was procured from Environmental Data Resources Inc. (EDR). The complete EDR database report is included in Appendix A. Due to the anticipated limited ground disturbance involved in the project, only sites with releases within 0.25 mile (state databases) of the project area were evaluated.

A comprehensive list of regulatory databases reviewed is contained in the EDR report (EDR 2022a, Appendix A).

1.2.2 Regulatory File Review

Some sites identified in the regulatory database review as having confirmed releases were further evaluated for pertinent details via the online Washington Department of Ecology (Ecology) Cleanup Site Search (Ecology 2022a). This tool provides additional details of site conditions and regulatory status as well as electronic site documents, where available.

1.2.3 Historical Review

The availability of historical aerial photographs for the project area was evaluated. Sanborn maps for the project area were not available. Historical aerial photographs for the years 1941, 1954, 1968, 1979, 1990, 2006, and 2017 for the project area (EDR 2022b, included in Appendix B) were reviewed for indications of land use that might be associated with use or storage of hazardous materials or petroleum hydrocarbons.

In addition, the EDR report described above makes available proprietary databases derived from historical city directories containing data related to businesses related to auto repair and fueling as well as dry cleaning, both of which are commonly related to soil and groundwater contamination. These proprietary historical databases were also evaluated for the project area.

2. AFFECTED ENVIRONMENT

This section describes the environmental setting and identifies hazardous materials sites within the main project area.

2.1 Geology and Hydrogeology

The subsurface in the vicinity of the project area includes varying layers of surficial fill associated with development that overlies native soils. The composition and compactness of the fill is unknown and is likely to be highly variable. Native soils beneath the fill consist of dense to very dense glacial sand and gravel outwash and glacial till. Groundwater within and adjacent to the project area is assumed to range from approximately 5 to 15 feet below ground surface (Ecology 2022b). Groundwater flow direction is not well defined for the area but is expected to follow topography in the project area and move toward water bodies, including branches of Quilceda Creek and sloughs associated with Puget Sound.

2.2 Regulatory Database Review

The affected environment within the study area was assessed by reviewing the state and federal regulatory database records, as described above. The identified sites were assigned to one of three risk categories based on the proximity to the study area; the type and number of databases in which the site was found; known releases of hazardous materials or petroleum products; and the status of remediation or cleanup efforts at sites with known releases. One of three risk categories was assigned to sites within the study area: high, medium, or low.

- **High Risk.** Sites that involve substantial contamination of large areas, including soil, groundwater, and multiple contaminants, and might represent higher risk of further releases of hazardous materials to human health or the environment; sites that would be likely to involve high levels of regulatory approvals or extensive or lengthy remediation activities that may create other impacts to the environment; or sites that could pose major delays to the development of the project.
- **Medium Risk.** Sites where the nature of potential contamination is known based on existing investigation data, the potential contaminants are not extremely toxic or difficult to treat, and probable remediation approaches are straightforward.
- **Low Risk.** Sites where the nature of potential contamination is known based on existing investigation data and are not expected to have notable impacts on the project due to their location; sites where hazardous materials were used but had no, or only very small, reported releases; or sites that have been remediated such that any impacts to the project would be minimal.

Sixteen sites located within 0.25 mile of the project area are listed in state databases that indicate a confirmed or potential for release of a hazardous material or petroleum hydrocarbons. One site, the Tulalip Landfill, listed as a former National Priorities List (Superfund) site, is located less than 0.5 mile south of the project area. This site does not impact the Project Area as the Ebey Slough lies between the landfill and Project Area creating a hydraulic barrier.

Based on location, regulatory status, and/or the minor nature and extent of the release, 13 of the 16 sites were determined to be low risk to impact the project area. The three remaining sites, all of which are in the vicinity of the 4th Street interchange (locations shown on Figure 2-1), were determined to be in the medium risk category and are discussed below.

Figure 1-2 - Hazardous Materials Sites
4th St NE and 88th St NE Interchange
Hazardous Materials Report

Marysville, WA

ARCO 4390 – 1124 4th Street

This site is listed in a number of state cleanup databases, including the Leaking Underground Storage Tank (LUST) database and the Confirmed and Suspected Contaminated Sites List (CSCSL). This gasoline station was confirmed to have leaked gasoline, diesel, and associated compounds to soil and groundwater from underground storage tanks (USTs) and associated piping. Based on the information reviewed to the extent possible, the USTs and soil contamination appear to be outside of the project area. The most recent groundwater monitoring data available (2019) indicated gasoline and associated compounds are below cleanup levels; however, the data for the site is limited and a large gap in monitoring appears to have occurred. Groundwater at the site may be as shallow as 8 to 10 feet below ground surface (Antea Group 2020). It does not appear that full cleanup of the site has occurred at this time, and the site is not currently in compliance with Ecology.

Chevron 99609 – 1206 4th Street

This site is listed in a number of state cleanup databases, including the LUST and CSCSL. This gasoline station is confirmed to have leaked gasoline and associated compounds to soil and groundwater from USTs and associated piping. The site is currently being cleaned up under the Washington Pollution Liability Insurance Agency (PLIA). Data from a recent investigation indicates that contaminant concentrations in groundwater exceed Model Toxics Control Act (MTCA) cleanup levels at the north end of the site, adjacent to the project area. Groundwater at the site may be as shallow as 7 to 10 feet below ground surface and moves to the north under the project area (Ecology 2017). It does not appear that full cleanup of the site has occurred at this time and residual concentrations may remain.

Marine Drive 76 – 3323 Marine Drive NE

This site is listed in the federal Indian LUST, which addresses LUST sites on tribal property. Releases were confirmed in 1996 and 2005. Cleanups were completed in 1997 and 2008. No detailed information is included for this site, including documentation of contamination left in place. This site currently operates as a Marathon gasoline station.

2.3 Historical Review

2.3.1 Historical Aerial Photographs

Historical aerial photographs of the study area were obtained from publicly available sources. Aerial photographs (EDR 2022b) were examined for the years 1941, 1954, 1968, 1979, 1990, 2006, and 2017. Observations are listed below.

88th Street NE Interchange

- 1941 – The majority of the project area is forested and undeveloped with a few rural residences.
- 1954 to 1990 – I-5 development is apparent in the 1954 photo. Construction is completed in 1968. Development increases east of I-5 and 88th Street NE is apparent in 1979.
- 2006 to 2017 – The interchange at 88th Street NE and I-5 is complete in the 2006 photo. Considerable commercial development around the interchange occurs between the 2006 and 2017. The area appears much as it does today in the 2017 aerial photo.

4th Street Interchange

- 1941 – Extensive residential development is apparent east of the future interchange. The railroad line is also apparent.
- 1954 to 1979 – I-5 development is apparent in the 1954 photo. The interstate is complete in the 1968 photo, and residential and commercial development continues through the 1979 aerial photo, particularly northwest of the interchange.
- 1990 to 2017 – Increased development around Marine Drive NE is apparent in the 1990 aerial photo. Significant development west of I-5 is apparent beginning in 2006. The area appears much as it does today in the 2017 aerial photo.

No additional sites of environmental concern or evidence of adverse conditions associated with land use were identified through the historical aerial photograph review.

2.3.2 EDR Proprietary Databases

Nine sites were identified in the EDR Historical Auto database and were located either within or adjacent to the project area. The three sites discussed above in Section 2.2 are all included in this database. The remaining six sites were determined to be of low risk to the project.

3. POTENTIAL IMPACTS

Many potential impacts and mitigation measures for hazardous materials are similar for all construction projects. This project involves relatively minor amounts of excavation to accommodate grading, utilities, and bridge construction. Construction impacts are considered short term in comparison to the lifespan of the completed project and would end when construction is complete. Potential construction and environmental effects related to the project are discussed below.

3.1 Construction Impacts

The hazardous materials analysis considered direct impacts of activities associated with the construction of the project. The analysis considered the impacts to human health and the environment as a result of possible release of contaminants or alteration of contaminant migration pathways during construction activities and considered the effects of existing contaminated sites.

Based on the developed nature of the project area, there is the potential that unknown or unidentified contamination in the subsurface (soil or groundwater) will be encountered during project construction activities. Unanticipated contamination can put workers at risk and can cause delays and costs not accounted for in the project schedule and budget.

No high-risk hazardous materials sites were identified during this analysis. The three medium-risk sites identified have some potential for impacts on construction, depending on the location of excavation associated with grading and utility placement.

Two of the medium-risk sites described in Section 2.2 above, Chevron 99609 (1206 4th Street) and Arco 4390 (1124 4th Street), will be slightly impacted by temporary construction easements (TCEs) and ROW acquisition. Chevron 99609 is proposed to have a very small area of its southwest corner (adjacent to the corner of 4th Street and Beach Avenue) used for a TCE. Arco 4390 will have a small strip of its northern edge along 4th Street used as a TCE with a very small area of permanent ROW acquisition at its northeast corner. Based on the size and the nature of these easements and acquisitions and the nature and extent of contamination on both of these sites, it is not expected that there will be any contaminated soil encountered or any impact to the sites or project.

Any impacts from these three sites would be expected to be minor and along ROW, depending on the location of improvements and utility relocation. At each of these three sites, there is the potential to encounter residual, low-level petroleum contaminated soil that was left in place in compliance with Ecology-approved site soil cleanup levels. In areas of deeper excavation, particularly in the vicinity of the Chevron 99609 site, there remains some potential (expected to be low to moderate) for vapors associated with residual gasoline contaminated groundwater to impact deeper excavations and workers.

3.2 Long-term Impacts

There are no known long-term impacts associated with hazardous materials unique to the project.

4. MITIGATION

Unexpected residual soil and groundwater contamination may be encountered during construction activities in portions of the project footprint. To mitigate potential impacts from all potential hazardous material sites, the Tulalip Tribes would perform a level of environmental due diligence appropriate to the size and presumed past use at any properties in the study area before they are acquired. The Tulalip Tribes may seek certain legal protections as part of the real property acquisition process to reduce its legal and financial risk.

If environmental concerns were identified through the initial due diligence process, or if a property being acquired has previously been identified as having releases of hazardous materials or existing contamination, the property may be subject to a subsurface investigation to determine the existence of contamination at the site and, if present, its nature and extent. The Tulalip Tribes may be responsible for the remediation of any contaminated soil and groundwater on properties that it acquires, including those previously unknown and found during construction. To the extent practicable, the Tulalip Tribes would also limit construction activities that might encounter contaminated groundwater or soil.

Based on the due diligence process, plans for the mitigation, handling, and disposal of contaminated media and hazardous construction debris would be developed on a site-by-site basis in conjunction with the appropriate regulatory agencies if determined to be necessary. A project-wide contaminated media management plan (CMMP) should also be developed and implemented and would be expected to cover the majority of minor encounters with contaminated soil or groundwater.

Mitigation related to the subsurface work north of the Chevron 99609 site would likely include work-area air monitoring in excavations in the event a gasoline odor were noted. It would also likely include the collection of groundwater samples if groundwater were encountered in deeper excavations in this area. Air and water results would aid in determining proper personal protective equipment for workers and water disposal options if dewatering is required.

Excavation in the vicinity of all three medium-risk sites would likely require adhering to the project CMMP in order to properly characterize any potentially petroleum contaminated soil for disposal.

Additionally, hazardous substances and petroleum products used during construction, such as fuels, paints, solvents, and other chemicals, would be managed and stored per the contractor's Spill, Prevention, Control, and Countermeasure (SPCC) plan. Best management practices (BMPs) would be followed in order to reduce the risk of spills, leaks, or other releases during construction activities. These BMPs could include the following:

- Fueling, maintenance, and cleaning in contained areas (e.g., berms)
- Minimization of the production or generation of hazardous materials
- Appropriate labeling and storage of hazardous waste per federal regulations
- Designated hazardous waste storage away from storm drains or surface water
- Recycling of materials (used oil- and water-based paint) as appropriate
- Handling any potential spills of hazardous materials in conformance with applicable Material Safety Data Sheets

5. CONCLUSIONS AND RECOMMENDATIONS

As described above, there are 16 sites with confirmed releases of hazardous materials or petroleum hydrocarbons to the subsurface within the study area. After evaluation, 13 of the 16 sites were determined to be of low risk to the project. The remaining three sites, all releases from former or current gas station infrastructure, were classified as medium risk to the project. Depending on precise excavation locations and depths determined during design, these three sites may require some amount of planning and mitigation to reduce risk to the project construction and project workers.

Parametrix concludes that no adverse cumulative effects from hazardous materials are anticipated to negatively impact the Project. No significant, unavoidable adverse effects are anticipated during construction due to the limited potential of encountering contaminated soil and/or groundwater that could be otherwise avoided by design decisions or mitigated through proper remediation.

Considering the conclusions above, Parametrix recommends the following:

1. The construction contract should include specifications advising the contractor of the appropriate handling and disposal of identified or suspected contamination that may be encountered during excavations or soil disturbances near or on the Project.
2. If any buildings or other structures are anticipated to be disturbed during the course of the project, WSDOT will perform an asbestos good faith inspection pre-bid to inform contractors of the presence or absence of asbestos in the structures.
3. Environmental impacts will be reevaluated if subsequent changes are made to the Project, such as project realignment, planned excavation depths, or changes to the proposed property acquisitions.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SUBJECT PROPERTY INFORMATION

ADDRESS

MARYSVILLE
MARYSVILLE, WA 98271

TARGET PROPERTY SEARCH RESULTS

The Target Property was identified in the following databases.

Page Numbers and Map Identifcations refer to the EDR Area/Corridor Report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

STANDARD ENVIRONMENTAL RECORDS

Lists of state and tribal registered storage tanks

WA UST: Underground Storage Tank Database

A review of the WA UST list, as provided by EDR, and dated 11/09/2021 has revealed that there is 1 WA UST site within the requested target property.

Site	Address	Map ID / Focus Map(s)	Page

Environmental Interest/Information System:
AIR PROGRAM - RESERVATION
ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include;

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Site Id:	507990
Decimal Latitude:	48.075275
Decimal Longitude:	-122.183188
Tank Name:	1
Tag Number:	A8456
Tank Status:	Operational
Tank Status Date:	12/10/1999
Tank Install Date:	03/15/1999
Tank Closure Date:	Not reported
Capacity Range:	20,000 to 29,999 Gallons
Tank Permit Expiration Date:	10/31/2022
Tank Upgrade Date:	03/15/1999
Tank Spill Prevention:	Spill Bucket/Spill Box
Tank Overfill Prevention:	Overfill Alarm
Tank Material:	Steel Clad with Corrosion Resistant Composite
Tank Construction:	Double Wall Tank
Tank Tightness Test:	Annual
Tank Corrosion Protection:	Corrosion Resistant
Tank Manifold:	Not reported
Tank Release Detection:	Interstitial Monitoring
Tank SFC Type:	Not reported
Pipe Material:	Flexible Piping
Pipe Construction:	Double Wall Pipe
Pipe Primary Release Detection:	Automatic Line Leak Detector (ALLD)
Pipe Second Release Detection:	Not reported
Pipe Corrosion Protection:	Corrosion Resistant
Pipe Pumping System:	Pressurized System
Responsible Unit:	Northwest

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a

SHELL OIL PRODUCTS US SAP 120555 (Continued) **1000660548**

means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Tank Name: 1
Tag Number: A4281
Tank Status: Operational
Tank Status Date: 11/01/1987
Tank Install Date: 11/01/1987
Tank Closure Date: Not reported
Capacity Range: 10,000 to 19,999 Gallons
Tank Permit Expiration Date: 03/31/2022
Tank Upgrade Date: 11/02/1998
Tank Spill Prevention: Spill Bucket/Spill Box
Tank Overfill Prevention: Automatic Shutoff (fill pipe)
Tank Material: Steel Clad with Corrosion Resistant Composite
Tank Construction: Double Wall Tank
Tank Tightness Test: Not reported
Tank Corrosion Protection: Corrosion Resistant
Tank Manifold: Auxiliary
Tank Release Detection: Interstitial Monitoring
Tank SFC Type: Sump
Pipe Material: Fiberglass
Pipe Construction: Double Wall Pipe
Pipe Primary Release Detection: Automatic Line Leak Detector (ALLD)
Pipe Second Release Detection: Interstitial Monitoring (or Sump Sensor)
Pipe Corrosion Protection: Corrosion Resistant
Pipe Pumping System: Pressurized System
Responsible Unit: Northwest
Dispencer/Pump SFC Type: Sump
Region: Northwest
Is Active: Yes
Actual Capacity: 12000
Pipe Install Date: Not reported
Turbine Sump Construction: Single Walled Sump
Compart Number: 1
Stored Substance: Unleaded Gasoline
Used Substance: Motor Fuel for Vehicles
Compart Capacity: 12000

Environmental Interest/Information System:

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste Code: D001
Waste Description: IGNITABLE WASTE

Waste Code: D002
Waste Description: CORROSIVE WASTE

Waste Code: D003
Waste Description: REACTIVE WASTE

Waste Code: D004
Waste Description: ARSENIC

Waste Code: D005
Waste Description: BARIUM

Waste Code: D006
Waste Description: CADMIUM

Waste Code: D007
Waste Description: CHROMIUM

Waste Code: D008
Waste Description: LEAD

Waste Code: D009
Waste Description: MERCURY

Waste Code: D010
Waste Description: SELENIUM

Waste Code: D011
Waste Description: SILVER

Waste Code: D016
Waste Description: 2,4-D (2,4-DICHLOROPHENOXYACETIC ACID)

Waste Code: D018
Waste Description: BENZENE

Waste Code: D022
Waste Description: CHLOROFORM

Waste Code: D024
Waste Description: M-CRESOL

WALMART SUPERCENTER 2595 (Continued) **1005445224**

Waste Code:	D025
Waste Description:	P-CRESOL
Waste Code:	D026
Waste Description:	CRESOL
Waste Code:	D027
Waste Description:	1,4-DICHLOROBENZENE
Waste Code:	D030
Waste Description:	2,4-DINITROTOLUENE
Waste Code:	D035
Waste Description:	METHYL ETHYL KETONE
Waste Code:	D039
Waste Description:	TETRACHLOROETHYLENE
Waste Code:	D040
Waste Description:	TRICHLORETHYLENE
Waste Code:	D043
Waste Description:	VINYL CHLORIDE
Waste Code:	P001
Waste Description:	2H-1-BENZOPYRAN-2-ONE, 4-HYDROXY-3-(3-OXO-1-PHENYLBUTYL)-, & SALTS, WHEN PRESENT AT CONCENTRATIONS GREATER THAN 0.3% (OR) WARFARIN, & SALTS, WHEN PRESENT AT CONCENTRATIONS GREATER THAN 0.3%
Waste Code:	P075
Waste Description:	NICOTINE, & SALTS (OR) PYRIDINE, 3-(1-METHYL-2-PYRROLIDINYL)-,(S)-, & SALTS
Waste Code:	U002
Waste Description:	2-PROPANONE (I) (OR) ACETONE (I)
Waste Code:	U034
Waste Description:	ACETALDEHYDE, TRICHLORO- (OR) CHLORAL
Waste Code:	U035
Waste Description:	BENZENEBUTANOIC ACID, 4-[BIS(2-CHLOROETHYL)AMINO]- (OR) CHLORAMBUCIL
Waste Code:	U058
Waste Description:	2H-1,3,2-OXAZAPHOSPHORIN-2-AMINE, N,N-BIS(2-CHLOROETHYL)TETRAHYDRO-, 2-OXIDE (OR) CYCLOPHOSPHAMIDE
Waste Code:	U072
Waste Description:	BENZENE, 1,4-DICHLORO- (OR) P-DICHLOROBENZENE
Waste Code:	U080
Waste Description:	METHANE, DICHLORO- (OR) METHYLENE CHLORIDE
Waste Code:	U112
Waste Description:	ACETIC ACID, ETHYL ESTER (I) (OR) ETHYL ACETATE (I)
Waste Code:	U122
Waste Description:	FORMALDEHYDE

WALMART SUPERCENTER 2595 (Continued) **1005445224**

Waste Code: U129
Waste Description: CYCLOHEXANE, 1,2,3,4,5,6-HEXACHLORO-, (1ALPHA, 2ALPHA, 3BETA, 4ALPHA, 5ALPHA, 6BETA)- (OR) LINDANE

Waste Code: U132
Waste Description: HEXACHLOROPHENE (OR) PHENOL, 2,2'-METHYLENEBIS[3,4,6-TRICHLORO-

Waste Code: U134
Waste Description: HYDROFLUORIC ACID (C,T) (OR) HYDROGEN FLUORIDE (C,T)

Waste Code: U150
Waste Description: L-PHENYLALANINE, 4-[BIS(2-CHLOROETHYL)AMINO]- (OR) MELPHALAN

Waste Code: U154
Waste Description: METHANOL (I) (OR) METHYL ALCOHOL (I)

Waste Code: U159
Waste Description: 2-BUTANONE (I,T) (OR) METHYL ETHYL KETONE (MEK) (I,T)

Waste Code: U165
Waste Description: NAPHTHALENE

Waste Code: U182
Waste Description: 1,3,5-TRIOXANE, 2,4,6-TRIMETHYL- (OR) PARALDEHYDE

Waste Code: U188
Waste Description: PHENOL

Waste Code: U200
Waste Description: RESERPINE (OR) YOHIMBAN-16-CARBOXYLIC ACID, 11,17-DIMETHOXY-18-[(3,4,5-TRIMETHOXYBENZOYL)OXY]-, METHYL ESTER, (3BETA, 16BETA, 17ALPHA, 18BETA, 20ALPHA)-

Waste Code: U205
Waste Description: SELENIUM SULFIDE (OR) SELENIUM SULFIDE SES2 (R,T)

Waste Code: U210
Waste Description: ETHENE, TETRACHLORO- (OR) TETRACHLOROETHYLENE

Waste Code: U240
Waste Description: 2,4-D, SALTS & ESTERS (OR) ACETIC ACID, (2,4-DICHLOROPHENOXY)-, SALTS & ESTERS (OR) DICHLOROPHENOXYACETIC ACID 2,4-D

Waste Code: U248
Waste Description: 2H-1-BENZOPYRAN-2-ONE, 4-HYDROXY-3-(3-OXO-1-PHENYL-BUTYL)-, & SALTS, WHEN PRESENT AT CONCENTRATIONS OF 0.3% OR LESS (OR) WARFARIN, & SALTS, WHEN PRESENT AT CONCENTRATIONS OF 0.3% OR LESS

Waste Code: U249
Waste Description: ZINC PHOSPHIDE ZN3P2, WHEN PRESENT AT CONCENTRATIONS OF 10% OR LESS

Waste Code: U279
Waste Description: U279

Waste Code: U409
Waste Description: CARBAMIC ACID, [1,2-PHENYLENEBIS (IMINOCARBONOTHIOYL)]BIS-, DIMETHYL ESTER (OR) THIOPHANATE-METHYL

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

B/E AEROSPACE FLIGHT STRUCTURES INC (Continued) **1007265554**

Waste Description: BENZENE

Waste Code: D035
Waste Description: METHYL ETHYL KETONE

Waste Code: D039
Waste Description: TETRACHLOROETHYLENE

Waste Code: D040
Waste Description: TRICHLORETHYLENE

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System:

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each

SEACAST INC (Continued) **1000387263**

facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.
AIR EMISSIONS CLASSIFICATION UNKNOWN
US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Click Here:

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource

MARYSVILLE OIL (Continued) **1000838794**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

CLEARCREEK CONTRACTORS EVERETT (Continued) **1011932042**

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	IGNITABLE WASTE
Waste Code:	D035
Waste Description:	METHYL ETHYL KETONE

ROY ROBINSON INC CNTY SITE (Continued) **1004793476**

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	IGNITABLE WASTE
Waste Code:	D002
Waste Description:	CORROSIVE WASTE
Waste Code:	D003
Waste Description:	REACTIVE WASTE
Waste Code:	D004
Waste Description:	ARSENIC
Waste Code:	D005
Waste Description:	BARIUM
Waste Code:	D006
Waste Description:	CADMIUM
Waste Code:	D007
Waste Description:	CHROMIUM
Waste Code:	D008
Waste Description:	LEAD
Waste Code:	D009
Waste Description:	MERCURY
Waste Code:	D010
Waste Description:	SELENIUM
Waste Code:	D011
Waste Description:	SILVER
Waste Code:	D016
Waste Description:	2,4-D (2,4-DICHLOROPHENOXYACETIC ACID)
Waste Code:	D018
Waste Description:	BENZENE
Waste Code:	D023
Waste Description:	O-CRESOL
Waste Code:	D035
Waste Description:	METHYL ETHYL KETONE
Waste Code:	D039
Waste Description:	TETRACHLOROETHYLENE
Waste Code:	D040
Waste Description:	TRICHLORETHYLENE
Waste Code:	U002
Waste Description:	2-PROPANONE (I) (OR) ACETONE (I)

HOME DEPOT 4726 (Continued) **1010337806**

Waste Code: U080
Waste Description: METHANE, DICHLORO- (OR) METHYLENE CHLORIDE

Waste Code: U160
Waste Description: 2-BUTANONE, PEROXIDE (R,T) (OR) METHYL ETHYL KETONE PEROXIDE (R,T)

Waste Code: U249
Waste Description: ZINC PHOSPHIDE ZN3P2, WHEN PRESENT AT CONCENTRATIONS OF 10% OR LESS

Waste Code: U279
Waste Description: U279

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport,

BAXTER AUTO REPAIR (Continued) **1004793403**

and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click Here:

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	IGNITABLE WASTE
Waste Code:	D005
Waste Description:	BARIUM
Waste Code:	D006
Waste Description:	CADMIUM
Waste Code:	D007
Waste Description:	CHROMIUM
Waste Code:	F003
Waste Description:	THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL

CHARLIES STATE AVENUE COLLISION REPAIR (Continued) **1004793773**

ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: D005
Waste Description: BARIUM

Waste Code: D006
Waste Description: CADMIUM

Waste Code: D007
Waste Description: CHROMIUM

Waste Code: D008
Waste Description: LEAD

Waste Code: D011
Waste Description: SILVER

Waste Code: D035
Waste Description: METHYL ETHYL KETONE

Waste Code: F003
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F005
Waste Description: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste Code: F006
Waste Description: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS, EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC, AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste Code: F007
Waste Description: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS.

Waste Code: F019
Waste Description: WASTEWATER TREATMENT SLUDGES FROM THE CHEMICAL CONVERSION COATING OF ALUMINUM, EXCEPT FROM ZIRCONIUM PHOSPHATING IN ALUMINUM CAN WASHING

METAL FINISHING INCORPORATED (Continued) **1000252105**

WHEN SUCH PHOSPHATING IS AN EXCLUSIVE CONVERSION COATING PROCESS.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the

METAL FINISHING INCORPORATED (Continued) **1000252105**

Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
OSHA ESTABLISHMENT
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Recipient Name:	Marysville, City of
Grant Type:	Cleanup
Property Number:	30053300201200
Parcel size:	9.49
Latitude:	48.046681
Longitude:	-122.176557
HCM Label:	Global Positioning Method-Unspecified Parameters
Map Scale:	-
Point of Reference:	Center of a Facility or Station
Highlights:	Notes - this property profile was amended to reflect a 'no cleanup completed' status. Cleanup activities have been initiated and now GW is being monitored. No NFA has been issued to date pending monitoring requirments. Originally the cleanup completed date was 07/11/2012. Previously 0.9 acres were deemed cleaned up - this was zeroed out until the final report/NFA issued as complete. Former Use: The property historically served as a sawmill, log yard, and boat-manufacturing facility owned by Crown Pacific, then by Interfor Pacific Corporation. The property is currently vacant, except for a remaining garage bay used for solid waste truck parking, and a small office building on-site that is used by City staff.

Property Description:	The property historically served as a sawmill, log yard, and boat-manufacturing facility owned by Crown Pacific, then by Interfor Pacific Corporation. The property is currently vacant, except for a remaining garage bay used for solid waste truck parking, and a small office building on-site that is used by City staff.

Tank Release Detection:	Interstitial Monitoring
Tank SFC Type:	Sump
Pipe Material:	Fiberglass
Pipe Construction:	Single Wall Pipe
Pipe Primary Release Detection:	Safe Suction (No Leak Detection)
Pipe Second Release Detection:	Safe Suction (No Leak Detection)
Pipe Corrosion Protection:	Corrosion Resistant
Pipe Pumping System:	Safe Suction
Responsible Unit:	Northwest
Dispencer/Pump SFC Type:	Sump
Region:	Northwest
Is Active:	Yes
Actual Capacity:	10000
Pipe Install Date:	Not reported
Turbine Sump Construction:	Single Walled Sump
Compart Number:	1
Stored Substance:	Unleaded Gasoline
Used Substance:	Motor Fuel for Vehicles
Compart Capacity:	10000
Name:	STATE ST FOOD MART
Address:	1034 STATE AVE
City:	MARYSVILLE

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.
HAZARDOUS WASTE BIENNIAL REPORTER

Environmental Interest/Information System:
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Name:	TULALIP MUNITIONS DEPOT
FUDS Number:	F10WA0050
City:	MARYSVILLE
State:	WA
County:	SNOHOMISH
Object ID:	3128
USACE Division:	NWD
USACE District:	Kansas City District (NWK)
Status:	Properties with all projects at site closeout
Current Owner:	TRIBE: NATIVE AMERICAN RESERVATION POC Name T.M. McKinsey
EMS Map Link:	https://fudsportal.usace.army.mil/ems/ems/inventory/map/map?id=56871
Eligibility:	Eligible
Has Projects:	Yes
NPL Status:	Not on the NPL
Property History:	Originally owned by the Army between 1946 and 1947, the site was declared excess in 1947. It was deeded to the Federal Land Bank, then sold to the Tulalip Indian Tribe in 1949. The Army leased the property from 1950 to 1959, and the Boeing Company used the property, presumably under contract to the military. Since then, Boeing has held a long-term lease on the facility from the Tulalip Tribe.
Project Required:	Yes
Feature Description:	Not reported
Latitude:	48.08555556
Longitude:	-122.20527778

FUDS Detail as of Jan 2015:

Fiscal Year:	2013
Federal Facility ID:	WA9799F3189
RAB:	Not reported
NPL Status:	Not Listed
Description:	The former Tulalip Munitions Depot comprises 2,175.41 acres. No hazardous materials are known to have originated from the Army's occupation of the site, which is currently known as the Boeing Aircraft Test Facility, located in Tulalip, Washington. This property is known or suspected to contain military munitions and explosives of concern (e.g., unexploded ordnance) and therefore may present an explosive hazard.
History:	Originally owned by the Army between 1946 and 1947, the site was declared excess in 1947. It was deeded to the Federal Land Bank, then sold to the Tulalip Indian Tribe in 1949. The Army leased the property from 1950 to 1959, and the Boeing Company used the property, presumably under contract to the military. Since then, Boeing has held a long-term lease on the facility from the Tulalip Tribe.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of Federal RCRA generators

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Lists of state- and tribal hazardous waste facilities

CSCSL: Confirmed and Suspected Contaminated Sites List

State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

Date of Government Version: 10/11/2021

State and tribal institutional control / engineering control registries

INST CONTROL: Institutional Control Site List

The Environmental Covenants Registry is a list of sites that have implemented institutional controls as part of the remedy. Institutional controls are administrative or legal measures used to prevent activities that may compromise the integrity of a cleanup action. They are meant to prevent exposure to contamination remaining on site. Institutional controls may include environmental covenants (also known as "deed restrictions"), zoning restrictions, public health advisories, or other administrative tools. The most common institutional control is an environmental covenant. Environmental covenants are legal recorded documents that typically limit certain uses of the property, such as: Drilling a water supply well on the property. Disturbing pavement covering contaminated areas. Residential use of the property.

PTAP: PTAP Site Listing

A list of sites accepted into the Petroleum Technical Assistance Program. The Petroleum Technical Assistance Program (PTAP) expands the state's ability to respond to the high customer demand to clean up petroleum contaminated sites. Under the PTAP, the Pollution Liability Insurance Agency (PLIA) may provide informal site-specific technical consultations and issue written opinion letters to persons conducting independent remedial actions at qualifying petroleum cleanup sites. PLIA may provide these services under the authority of RCW 70.149.040(9) and the Model Toxics Control Act (MTCA), Chapter 70.149 RCW and Chapter 173-340 WAC.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs
A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SSTS: Section 7 Tracking Systems

Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historical Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

TACOMA/PIERCE COUNTY:

LF TACOMA/PIERCE: Closed Landfill Survey

Following numerous requests for information about closed dumpsites and landfills in Pierce County, the Tacoma-Pierce County Health Department decided to conduct a study on the matter. The aim of the study was to evaluate public health risks associated with the closed dumpsites and landfills, and to determine the need, if any, for further investigations of a more detailed nature. The sites represent all of the known dumpsites and landfills closed after 1950.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 11/11/2021
Date Data Arrived at EDR: 11/12/2021
Date Made Active in Reports: 02/01/2022

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.
